Preface	5
Session info	5
1 Introduction to R	7
1.1 About this module	7
1.2 R programming language	7
1.3 Schedule	8
1.4 Reference books	8
1.5 R	9
1.6 Interpreting values	9
1.7 Basic types	10
1.8 Numeric operators	10
1.9 Logical operators	10
1.10 Summary	11
2 Core concepts	13
2.1 Recap	13
2.2 Variables	13
2.3 Algorithms and functions	14
2.4 Functions	14
2.5 Functions and variables	15
2.6 Naming	15
2.7 Coding style	15

2.8 stringr	16
2.9 Summary	17
3 Tidyverse	19
3.1 Recap	19
3.2 The pipe operator	19
3.3 Pipe example	20
3.4 Pipe example	20
3.5 Summary	21
4 Data types	23
4.1 Recap	23
4.2 Vectors	23
4.3 Defining vectors	24
4.4 Creating vectors	24
4.5 Selection	25
4.6 Functions on vectors	25
4.7 Any and all	25
4.8 Factors	26
4.9 table	26
4.10 Specified levels	27
4.11 (Unordered) Factors	27
4.12 Ordered Factors	28
4.13 Matrices	28
4.14 Arrays	28
4.15 Arrays	29
4.16 Selection	29
4.17 apply	30
4.18 Lists	30
4.19 Named Lists	30
4.20 lapply	31
4.21 Recap	31

CONTENTS	5
5 Control structures	33
5.1 Recap	33
5.2 If	33
5.3 Else	34
5.4 Code blocks	34
5.5 Loops	35
5.6 While	35
5.7 For	35
5.8 For	36
5.9 Loops with conditional statements	36
5.10 Summary	37
6 Functions	39
6.1 Summary	39
6.2 Defining functions	39
6.3 Defining functions	40
6.4 Defining functions	40
6.5 More parameters	40
6.6 Functions and control structures	41
6.7 Scope	41
6.8 Example	41
6.9 Summary	42
7 Data Frames	43
7.1 Recap	43
7.2 Selection	44
7.3 Selection	44
7.4 Value assignment	44
7.5 Column processing	45
7.6 tibble	45
7.7 Summary	45

8 Selection and filtering	47
8.1 Recap	47
8.2 dplyr	47
8.3 Example dataset	48
8.4 dplyr::select	48
8.5 dplyr::select	49
8.6 Logical filtering	49
8.7 Conditional filtering	49
8.8 Filtering data frames	50
8.9 dplyr::filter	50
8.10 Summary	51
9 Data manipulation	53
9.1 Recap	53
9.2 dplyr	53
9.3 Libraries	54
9.4 dplyr::arrange	54
9.5 dplyr::summarise	54
9.6 dplyr::group_by	55
9.7 dplyr::mutate	55
9.8 Full pipe example	56
9.9 Summary	56
10 Join operations	59
10.1 Recap	59
10.2 Joining data	59
10.3 Join types	60
10.4 Example	60
10.5 Example	60
10.6 dplyr::full_join	61
10.7 dplyr::left_join	61
10.8 dplyr::right_join	62

CONTENTS	7
10.9 dplyr::inner_join	62
10.10 Summary	62
11 Data pivot	63
11.1 Recap	63
11.2 Wide data	63
11.3 Long data	64
11.4 Libraries	64
11.5 tidyr	64
11.6 tidyr::gather	65
11.7 tidyr::spread	65
11.8 Summary	66
12 Read and write data	67
12.1 Summary	67
12.2 Comma Separated Values	67
12.3 Libraries	68
12.4 Read	68
12.5 Write	68
12.6 Summary	69
13 Reproducibility	71
13.1 Recap	71
13.2 Reproduciblity	71
13.3 Why?	72
13.4 Reproducibility and software engineering	72
13.5 Reproducibility and “big data”	72
13.6 Reproducibility in GIScience	73
13.7 Document everything	73
13.8 Document well	73
13.9 Workflow	74
13.10 Future-proof formats	74

13.11 Store and share	74
13.12 This repository	75
13.13 Summary	75
14 RMarkdown	77
14.1 Recap	77
14.2 Markdown	77
14.3 Markdown example code	78
14.4 Markdown example output	78
14.5 RMarkdown example code	78
14.6 Writing RMarkdown docs	79
14.7 Summary	79
15 Git	81
15.1 Recap	81
15.2 What's git?	81
15.3 How git works	82
15.4 Three stages	82
15.5 Basic git commands	83
15.6 Git and RStudio	83
15.7 Summary	84
16 Data visualisation	85
16.1 Recap	85
16.2 Visual variables	85
16.3 Grammar of graphics	86
16.4 ggplot2	86
16.5 Histograms	86
16.6 Histograms	87
16.7 Boxplots	88
16.8 Boxplots	88
16.9 Jittered points	88

CONTENTS	9
16.10 Jittered points	89
16.11 Violin plot	89
16.12 Violin plot	90
16.13 Lines	90
16.14 Lines	91
16.15 Scatterplots	91
16.16 Scatterplots	92
16.17 Overlapping points	92
16.18 Overlapping points	93
16.19 Bin counts	93
16.20 Bin counts	94
16.21 Summary	94
17 Descriptive statistics	95
17.1 Summary	95
17.2 Libraries and data	95
17.3 Descriptive statistics	96
17.4 stat.desc output	96
17.5 stat.desc: basic	96
17.6 stat.desc: desc	97
17.7 Sample statistics	97
17.8 Estimating variation	97
17.9 dplyr::across	98
17.10 Summary	98
18 Exploring assumptions	99
18.1 Recap	99
18.2 Libraries and data	99
18.3 Normal distribution	100
18.4 Density histogram	100
18.5 Q-Q plot	101
18.6 stat.desc: norm	101

18.7 Normality	101
18.8 Significance	102
18.9 Skewness and kurtosis	102
18.10 Homogeneity of variance	103
18.11 Summary	103
19 Comparing groups	105
19.1 Recap	105
19.2 Libraries	106
19.3 Example	106
19.4 T-test	107
19.5 Example	107
19.6 ANOVA	108
19.7 Example	108
19.8 Summary	108
20 Correlation	111
20.1 Recap	111
20.2 Correlation	111
20.3 Libraries and data	112
20.4 Example	112
20.5 Example	112
20.6 Pearson's r	113
20.7 Spearman's rho	114
20.8 Kendall's tau	114
20.9 Pairs plot	114
20.10 Summary	115
21 Data transformations	117
21.1 Recap	117
21.2 Libraries and data	117
21.3 Z-scores	118

CONTENTS	11
21.4 Log transformation	118
21.5 Inverse hyperbolic sine	119
21.6 Summary	119
22 Simple Regression	121
22.1 Recap	121
22.2 Regression analysis	121
22.3 Least squares	122
22.4 Libraries and data	122
22.5 Example	122
22.6 Overall fit	123
22.7 Parameters	123
22.8 Summary	124
23 Assessing regression assumptions	125
23.1 Recap	125
23.2 Checking assumptions	125
23.3 Libraries and data	126
23.4 Example	126
23.5 Normality	127
23.6 Homoscedasticity	127
23.7 Independence	128
23.8 Summary	128
24 Multiple Regression	131
24.1 Recap	131
24.2 TO-DO	131
24.3 Summary	131

25 Machine Learning	133
25.1 Recap	133
25.2 Definition	133
25.3 Origines	133
25.4 Types of machine learning	134
25.5 Supervised	135
25.6 Unsupervised	135
25.7 ... more	135
25.8 Neural networks	136
25.9 Deep neural networks	137
25.10 Convolutional neural networks	137
25.11 Limits	138
25.12 Summary	138
26 Centroid-based clustering	139
26.1 Recap	139
26.2 Clustering task	139
26.3 Example	140
26.4 k-means	141
26.5 K-means result	142
26.6 Fuzzy c-means	142
26.7 Fuzzy c-means	143
26.8 Fuzzy c-means result	144
26.9 Geodemographic classifications	144
26.10 Summary	144
27 Hierarchical and density-based clustering	147
27.1 Recap	147
27.2 Libraries	147
27.3 Example	148
27.4 Hierarchical clustering	148
27.5 Clustering tree	148

CONTENTS	13
27.6 Hierarchical clustering result	150
27.7 Bagged clustering	150
27.8 Bagged clustering result	151
27.9 Density based clustering	151
27.10DBSCAN result	152
27.11Summary	152
28 kNN	153
28.1 Recap	153
28.2 TO-DO	153
28.3 Summary	153
29 Support vector machines	155
29.1 Recap	155
29.2 TO-DO	155
29.3 Summary	155
30 Deep learning	157
30.1 Recap	157
30.2 TO-DO	157
30.3 Summary	157

Preface

Stefano De Sabbata

This work is licensed under the GNU General Public License v3.0. Contains public sector information licensed under the Open Government Licence v3.0.

This book contains the *lectures* component of granolarr, a repository of reproducible materials to teach geographic information and data science in R. Part of the materials are derived from the lectures for the module GY7702 Practical Programming in R of the MSc in Geographic Information Science at the School of Geography, Geology, and the Environment of the University of Leicester, by Dr Stefano De Sabbata.

This book was created using R, RStudio, RMarkdown, Bookdown, and GitHub.

Chapter 1

Introduction to R

1.1 About this module

This module will provide you with the fundamental skills in

- basic programming in R
- reproducibility
- data wrangling
- data analysis

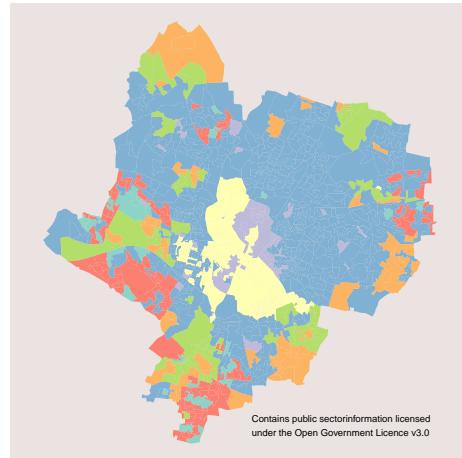

basis for

- *Geospatial Data Analysis*
- *Geospatial Databases and Information Retrieval*

1.2 R programming language

One of the most widely used programming languages and an effective tool for (*geospatial*) data science

- data wrangling
- statistical analysis
- machine learning
- data visualisation and maps
- processing spatial data
- geographic information analysis

1.3 Schedule

The lectures and practical sessions have been designed to follow the schedule below

- **1 R coding**
 - 100 Introduction
 - 110 R programming
- **2 Data wrangling**
 - 200 Selection and manipulation
 - 210 Table operations
 - 220 Reproducibility
- **3 Data analysis**
 - 300 Exploratory data analysis
 - 310 Comparing data
 - 320 Regression models
- **4 Machine learning**
 - 400 Unsupervised
 - 410 Supervised

1.4 Reference books

Suggested reading

- *Programming Skills for Data Science: Start Writing Code to Wrangle, Analyze, and Visualize Data with R* by Michael Freeman and Joel Ross, Addison-Wesley, 2019. See book webpage and repository.
- *Machine Learning with R: Expert techniques for predictive modeling* by Brett Lantz, Packt Publishing, 2019. See book webpage.

Further reading

- *The Art of R Programming: A Tour of Statistical Software Design* by Norman Matloff, No Starch Press, 2011. See book webpage

- *Discovering Statistics Using R* by Andy Field, Jeremy Miles and Zoë Field, SAGE Publications Ltd, 2012. See book webpage.
- *R for Data Science* by Garrett Grolemund and Hadley Wickham, O'Reilly Media, 2016. See online book.
- *An Introduction to R for Spatial Analysis and Mapping* by Chris Brunsdon and Lex Comber, Sage, 2015. See book webpage

1.5 R

Created in 1992 by Ross Ihaka and Robert Gentleman at the University of Auckland, New Zealand

- Free, open-source implementation of S
 - statistical programming language
 - Bell Labs
- Functional programming language
- Supports (and commonly used as) procedural (i.e., imperative) programming
- Object-oriented
- Interpreted (not compiled)

1.6 Interpreting values

When values and operations are inputted in the *Console*, the interpreter returns the results of its interpretation of the expression

2

```
## [1] 2
"String value"
## [1] "String value"
# comments are ignored
```

1.7 Basic types

R provides three core data types

- numeric
 - both integer and real numbers
- character
 - i.e., text, also called *strings*
- logical
 - TRUE or FALSE

1.8 Numeric operators

R provides a series of basic numeric operators

Operator	Meaning	Example	Output
+	Plus	5 + 2	7
-	Minus	5 - 2	3
*	Product	5 * 2	10
/	Division	5 / 2	2.5
%/%	Integer division	5 %/% 2	2
%%	Module	5 %% 2	1
^	Power	5^2	25

```
5 + 2
```

```
## [1] 7
```

1.9 Logical operators

R provides a series of basic logical operators to test

Operator	Meaning	Example	Output
==	Equal	5 == 2	FALSE
!=	Not equal	5 != 2	TRUE
> (>=)	Greater (or equal)	5 > 2	TRUE
< (<=)	Less (or equal)	5 <= 2	FALSE

Operator	Meaning	Example	Output
!	Not	!TRUE	FALSE
&	And	TRUE & FALSE	FALSE
	Or	TRUE FALSE	TRUE

```
5 >= 2
```

```
## [1] TRUE
```

1.10 Summary

An introduction to R

- Basic types
- Basic operators

Next: Core concepts

- Variables
- Functions
- Libraries

Chapter 2

Core concepts

2.1 Recap

Prev: An introduction to R

- Basic types
- Basic operators

Now: Core concepts

- Variables
- Functions
- Libraries

2.2 Variables

Variables **store data** and can be defined

- using an *identifier* (e.g., `a_variable`)
- on the left of an *assignment operator* `<-`
- followed by the object to be linked to the identifier
- such as a *value* (e.g., `1`)

```
a_variable <- 1
```

The value of the variable can be invoked by simply specifying the **identifier**.

```
a_variable
```

```
## [1] 1
```

2.3 Algorithms and functions

An **algorithm** or *effective procedure* is a mechanical rule, or automatic method, or programme for performing some mathematical operation (Cutland, 1980).

A **program** is a specific set of instructions that implement an abstract algorithm.

The definition of an algorithm (and thus a program) can consist of one or more **functions**

- set of instructions that preform a task
- possibly using an input, possibly returning an output value

Programming languages usually provide pre-defined functions that implement common algorithms (e.g., to find the square root of a number or to calculate a linear regression)

2.4 Functions

Functions execute complex operations and can be invoked

- specifying the *function name*
- the *arguments* (input values) between simple brackets
 - each *argument* corresponds to a *parameter*
 - sometimes the *parameter* name must be specified

```
sqrt(2)
```

```
## [1] 1.414214
```

```
round(1.414214, digits = 2)
```

```
## [1] 1.41
```

2.5 Functions and variables

- functions can be used on the right side of <-
- variables and functions can be used as *arguments*

```
sqrt_of_two <- sqrt(2)  
sqrt_of_two
```

```
## [1] 1.414214
```

```
round(sqrt_of_two, digits = 2)
```

```
## [1] 1.41
```

```
round(sqrt(2), digits = 2)
```

```
## [1] 1.41
```

2.6 Naming

When creating an identifier for a variable or function

- R is a **case sensitive** language
 - UPPER and lower case are not the same
 - `a_variable` is different from `a_VARIABLE`
- names can include
 - alphanumeric symbols
 - `.` and `_`
- names must start with
 - a letter

2.7 Coding style

A *coding style* is a way of writing the code, including

- how variable and functions are named

- lower case and `_`
- how spaces are used in the code
- which libraries are used

```
# Bad
X<-round(sqrt(2),2)

#Good
sqrt_of_two <- sqrt(2) %>%
  round(digits = 2)
```

Study the Tidyverse Style Guid and use it consistently!

2.8 stringr

R provides some basic functions to manipulate strings, but the `stringr` library provides a more consistent and well-defined set

```
library(tidyverse)

## -- Attaching packages -----
## v ggplot2 3.3.2     v purrr    0.3.4
## v tibble   3.0.3     v dplyr    1.0.0
## v tidyverse 1.1.0     v stringr  1.4.0
## v readr    1.3.1     vforcats  0.5.0

## -- Conflicts -----
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()   masks stats::lag()

str_length("Leicester")

## [1] 9

str_detect("Leicester", "e")

## [1] TRUE
```

```
str_replace_all("Leicester", "e", "x")
```

```
## [1] "Lxicxstxr"
```

2.9 Summary

Core concepts

- Variables
- Functions
- Libraries

Next: Tidyverse

- Tidyverse libraries
- *pipe* operator

Chapter 3

Tidyverse

3.1 Recap

Prev: Core concepts

- Variables
- Functions
- Libraries

Now: Tidyverse

- Tidyverse libraries
- *pipe* operator

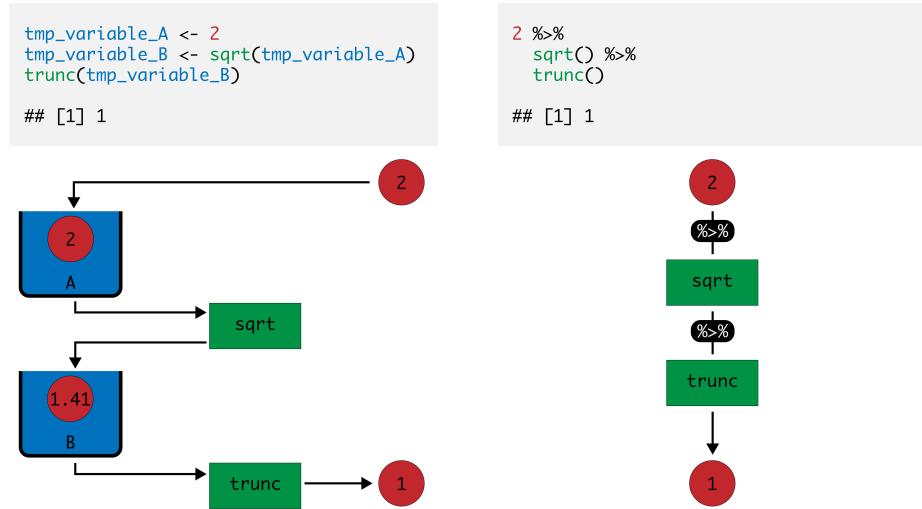

3.2 The pipe operator

The Tidyverse also provide a clean and effective way of combining multiple manipulation steps

The pipe operator `%>%`

- takes the result from one function
- and passes it to the next function
- as the **first argument**
- that doesn't need to be included in the code anymore

3.3 Pipe example

3.4 Pipe example

The two codes below are equivalent

- the first simply invokes the functions
- the second uses the pipe operator %>%

```
round(sqrt(2), digits = 2)
```

```
## [1] 1.41
```

```
library(tidyverse)
```

```
## -- Attaching packages -----
```

```
## v ggplot2 3.3.2      v purrr    0.3.4
## v tibble   3.0.3      v dplyr    1.0.0
## v tidyverse 1.1.0      v stringr  1.4.0
## v readr    1.3.1      vforcats  0.5.0
```

```
## -- Conflicts -----
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()   masks stats::lag()
```

```
sqrt(2) %>%
  round(digits = 2)

## [1] 1.41
```

3.5 Summary

Tidyverse

- Tidyverse libraries
- *pipe* operator

Next: Practical session

- The R programming language
- Interpreting values
- Variables
- Basic types
- Tidyverse
- Coding style

Chapter 4

Data types

4.1 Recap

Prev: Introduction

- 101 Lecture: Introduction to R
- 102 Lecture: Core concepts
- 103 Lecture: Tidyverse
- 104 Practical session

Now: Data types

- vectors
- factors
- matrices, arrays
- lists

4.2 Vectors

Vectors are ordered list of values.

- Vectors can be of any data type
 - numeric
 - character
 - logic
- All items in a vector have to be of the same type
- Vectors can be of any length

4.3 Defining vectors

A vector variable can be defined using

- an **identifier** (e.g., `a_vector`)
- on the left of an **assignment operator** `<-`
- followed by the object to be linked to the identifier
- in this case, the result returned by the function `c`
- which creates a vector containing the element provided as input

```
a_vector <- c("Birmingham", "Derby", "Leicester",
             "Lincoln", "Nottingham", "Wolverhampton")
a_vector

## [1] "Birmingham"      "Derby"           "Leicester"        "Lincoln"
## [5] "Nottingham"     "Wolverhampton"
```

4.4 Creating vectors

- the operator `:`
- the function `seq`
- the function `rep`

[4.7](#)

```
## [1] 4 5 6 7

seq(1, 7, by = 0.5)

## [1] 1.0 1.5 2.0 2.5 3.0 3.5 4.0 4.5 5.0 5.5 6.0 6.5 7.0

seq(1, 10, length.out = 7)

## [1] 1.0 2.5 4.0 5.5 7.0 8.5 10.0

rep("Ciao", 4)

## [1] "Ciao" "Ciao" "Ciao" "Ciao"
```

4.5 Selection

Each element of a vector can be retrieved specifying the related **index** between square brackets, after the identifier of the vector. The first element of the vector has index 1.

```
a_vector[3]
```

```
## [1] "Leicester"
```

A vector of indexes can be used to retrieve more than one element.

```
a_vector[c(5, 3)]
```

```
## [1] "Nottingham" "Leicester"
```

4.6 Functions on vectors

Functions can be used on a vector variable directly

```
a_numeric_vector <- 1:5
a_numeric_vector + 10
```

```
## [1] 11 12 13 14 15
```

```
sqrt(a_numeric_vector)
```

```
## [1] 1.000000 1.414214 1.732051 2.000000 2.236068
```

```
a_numeric_vector >= 3
```

```
## [1] FALSE FALSE TRUE TRUE TRUE
```

4.7 Any and all

Overall expressions can be tested using the functions:

- **any**, TRUE if any of the elements satisfies the condition
- **all**, TRUE if all of the elements satisfy the condition

```
any(a_numeric_vector >= 3)

## [1] TRUE

all(a_numeric_vector >= 3)

## [1] FALSE
```

4.8 Factors

A **factor** is a data type similar to a vector. However, the values contained in a factor can only be selected from a set of **levels**.

```
houses_vector <- c("Bungalow", "Flat", "Flat",
  "Detached", "Flat", "Terrace", "Terrace")
houses_vector

## [1] "Bungalow" "Flat"      "Flat"      "Detached" "Flat"      "Terrace"   "Terrace"

houses_factor <- factor(c("Bungalow", "Flat", "Flat",
  "Detached", "Flat", "Terrace", "Terrace"))
houses_factor

## [1] Bungalow Flat      Flat      Detached Flat      Terrace  Terrace
## Levels: Bungalow Detached Flat Terrace
```

4.9 table

The function **table** can be used to obtain a tabulated count for each level.

```
houses_factor <- factor(c("Bungalow", "Flat", "Flat",
  "Detached", "Flat", "Terrace", "Terrace"))
houses_factor

## [1] Bungalow Flat      Flat      Detached Flat      Terrace  Terrace
## Levels: Bungalow Detached Flat Terrace
```

```
table(houses_factor)

## houses_factor
## Bungalow Detached     Flat   Terrace
##      1         1         3         2
```

4.10 Specified levels

A specific set of levels can be specified when creating a factor by providing a **levels** argument.

```
houses_factor_spec <- factor(
  c("People Carrier", "Flat", "Flat", "Hatchback",
    "Flat", "Terrace", "Terrace"),
  levels = c("Bungalow", "Flat", "Detached",
            "Semi", "Terrace"))

table(houses_factor_spec)

## houses_factor_spec
## Bungalow     Flat Detached     Semi   Terrace
##      0         3         0         0         2
```

4.11 (Unordered) Factors

In statistics terminology, (unordered) factors are **categorical** (i.e., binary or nominal) variables. Levels are not ordered.

```
income_nominal <- factor(
  c("High", "High", "Low", "Low", "Low",
    "Medium", "Low", "Medium"),
  levels = c("Low", "Medium", "High"))
income_nominal > "Low"

## Warning in Ops.factor(income_nominal, "Low"): '>' not meaningful for factors

## [1] NA NA NA NA NA NA NA NA NA
```

4.12 Ordered Factors

In statistics terminology, ordered factors are **ordinal** variables. Levels are ordered.

```
income_ordered <- ordered(
  c("High", "High", "Low", "Low", "Low",
    "Medium", "Low", "Medium"),
  levels = c("Low", "Medium", "High"))
income_ordered > "Low"

## [1] TRUE TRUE FALSE FALSE FALSE TRUE FALSE TRUE

sort(income_ordered)

## [1] Low     Low     Low     Low     Medium Medium High   High
## Levels: Low < Medium < High
```

4.13 Matrices

Matrices are collections of numerics arranged in a two-dimensional rectangular layout

- the first argument is a vector of values
- the second specifies number of rows and columns
- R offers operators and functions for matrix algebra

```
a_matrix <- matrix(c(3, 5, 7, 4, 3, 1), c(3, 2))
a_matrix

##      [,1] [,2]
## [1,]     3     4
## [2,]     5     3
## [3,]     7     1
```

4.14 Arrays

Variables of the type **array** are higher-dimensional matrices.

- the first argument is a vector containing the values

- the second argument is a vector specifying the depth of each dimension

```
a3dim_array <- array(1:24, dim=c(4, 3, 2))
```

4.15 Arrays

```
a3dim_array
```

```
## , , 1
##
##      [,1] [,2] [,3]
## [1,]    1    5    9
## [2,]    2    6   10
## [3,]    3    7   11
## [4,]    4    8   12
##
## , , 2
##
##      [,1] [,2] [,3]
## [1,]   13   17   21
## [2,]   14   18   22
## [3,]   15   19   23
## [4,]   16   20   24
```

4.16 Selection

Subsets of matrices (and arrays) can be selected as seen for vectors.

```
a_matrix[2, c(1, 2)]
## [1] 5 3

a3dim_array[c(1, 2), 2, 2]
## [1] 17 18
```

4.17 apply

`apply` applies another function to each level of a set dimension of an array

```
apply(a3dim_array, 3, min) # apply on third dimension
```

```
## [1] 1 13
```

```
apply(a3dim_array, 1, min) # apply on first dimension
```

```
## [1] 1 2 3 4
```

```
apply(a3dim_array, 2, min) # apply on second dimension
```

```
## [1] 1 5 9
```

4.18 Lists

Variables of the type `list` can contain elements of different types (including vectors and matrices), whereas elements of vectors are all of the same type.

```
employee <- list("Stefano", 2015)
employee
```

```
## [[1]]
## [1] "Stefano"
##
## [[2]]
## [1] 2015
```

```
employee[[1]] # Note the double square brackets for selection
```

```
## [1] "Stefano"
```

4.19 Named Lists

In **named lists** each element has a name, and elements can be selected to using their name after the symbol `$`.

```
employee <- list(name = "Stefano", start_year = 2015)
employee

## $name
## [1] "Stefano"
##
## $start_year
## [1] 2015

employee$name

## [1] "Stefano"
```

4.20 lapply

With `lapply` take care that the function makes sense for *any* element in the list

```
various <- list(
  "Some text",
  matrix(c(6, 3, 1, 2), c(2, 2))
)
lapply(various, is.numeric)

## [[1]]
## [1] FALSE
##
## [[2]]
## [1] TRUE
```

4.21 Recap

Data types

- Vectors
- Factors
- Matrices, arrays
- Lists

Next: Control structures

- Conditional statements
- Loops

Chapter 5

Control structures

5.1 Recap

Prev: Data types

- Vectors
- Factors
- Arrays
- Lists

Now: Control structures

- Conditional statements
- Loops

5.2 If

Format: `if (condition) statement`

- *condition*: expression returning a logic value (TRUE or FALSE)
- *statement*: any valid R statement
- *statement* only executed if *condition* is TRUE

```
a_value <- -7
if (a_value < 0) cat("Negative")

## Negative
```

```
a_value <- 8
if (a_value < 0) cat("Negative")
```

5.3 Else

Format: `if (condition) statement1 else statement2`

- *condition*: expression returning a logic value (TRUE or FALSE)
- *statement1* and *statement2*: any valid R statements
- *statement1* executed if *condition* is TRUE
- *statement2* executed if *condition* is FALSE

```
a_value <- -7
```

```
if (a_value < 0) cat("Negative") else cat("Positive")
```

```
## Negative
```

```
a_value <- 8
```

```
if (a_value < 0) cat("Negative") else cat("Positive")
```

```
## Positive
```

5.4 Code blocks

Suppose you want to execute **several** statements within a function, or if a condition is true

- Such a group of statements are called **code blocks**
- { and } contain code blocks

```
first_value <- 8
second_value <- 5
if (first_value > second_value) {
  cat("First is greater than second\n")
  difference <- first_value - second_value
  cat("Their difference is ", difference)
}
```

```
## First is greater than second
## Their difference is  3
```

5.5 Loops

Loops are a fundamental component of (procedural) programming.

There are two main types of loops:

- **conditional** loops are executed as long as a defined condition holds true
 - construct `while`
 - construct `repeat`
- **deterministic** loops are executed a pre-determined number of times
 - construct `for`

5.6 While

The `while` construct can be defined using the `while` reserved word, followed by the conditional statement between simple brackets, and a code block. The instructions in the code block are re-executed as long as the result of the evaluation of the conditional statement is TRUE.

```
current_value <- 0

while (current_value < 3) {
  cat("Current value is", current_value, "\n")
  current_value <- current_value + 1
}

## Current value is 0
## Current value is 1
## Current value is 2
```

5.7 For

The `for` construct can be defined using the `for` reserved word, followed by the definition of an **iterator**. The iterator is a variable which is temporarily assigned with the current element of a vector, as the construct iterates through all elements of the list. This definition is followed by a code block, whose instructions are re-executed once for each element of the vector.

```
cities <- c("Derby", "Leicester", "Lincoln", "Nottingham")
for (city in cities) {
  cat("Do you live in", city, "?\n")
```

```
## Do you live in Derby ?
## Do you live in Leicester ?
## Do you live in Lincoln ?
## Do you live in Nottingham ?
```

5.8 For

It is common practice to create a vector of integers on the spot in order to execute a certain sequence of steps a pre-defined number of times.

```
for (i in 1:3) {
  cat("This is execution number", i, ":\n")
  cat("    See you later!\n")
}
```

```
## This is execution number 1 :
##     See you later!
## This is execution number 2 :
##     See you later!
## This is execution number 3 :
##     See you later!
```

5.9 Loops with conditional statements

3:0

```
## [1] 3 2 1 0
```

#Example: countdown!

```
for (i in 3:0) {
  if (i == 0) {
    cat("Go!\n")
  } else {
    cat(i, "\n")
  }
}
```

```
## 3
## 2
## 1
## Go!
```

5.10 Summary

Control structures

- Conditional statements
- Loops

Next: Functions

- Defining functions
- Scope of a variable

Chapter 6

Functions

6.1 Summary

Prev: Control structures

- Conditional statements
- Loops

Now: Functions

- Defining functions
- Scope of a variable

6.2 Defining functions

A function can be defined

- using an **identifier** (e.g., `add_one`)
- on the left of an **assignment operator** `<-`
- followed by the corpus of the function

```
add_one <- function (input_value) {  
  output_value <- input_value + 1  
  output_value  
}
```

6.3 Defining functions

The corpus

- starts with the reserved word `function`
- followed by the **parameter(s)** (e.g., `input_value`) between simple brackets
- and the instruction(s) to be executed in a code block
- the value of the last statement is returned as output

```
add_one <- function (input_value) {
  output_value <- input_value + 1
  output_value
}
```

6.4 Defining functions

After being defined, a function can be invoked by specifying the **identifier**

```
add_one (3)
```

```
## [1] 4
```

6.5 More parameters

- a function can be defined as having two or more **parameters** by specifying more than one parameter name (separated by **commas**) in the function definition
- a function always take as input as many values as the number of parameters specified in the definition
 - otherwise an error is generated

```
area_rectangle <- function (height, width) {
  area <- height * width
  area
}

area_rectangle(3, 2)
```

```
## [1] 6
```

6.6 Functions and control structures

Functions can contain both loops and conditional statements in their corpus

```
factorial <- function (input_value) {
  result <- 1
  for (i in 1:input_value) {
    cat("current:", result, " | i:", i, "\n")
    result <- result * i
  }
  result
}
factorial(3)

## current: 1 | i: 1
## current: 1 | i: 2
## current: 2 | i: 3

## [1] 6
```

6.7 Scope

The **scope of a variable** is the part of code in which the variable is “visible”

In R, variables have a **hierarchical** scope:

- a variable defined in a script can be used referred to from within a definition of a function in the same script
- a variable defined within a definition of a function will **not** be referable from outside the definition
- scope does **not** apply to **if** or loop constructs

6.8 Example

In the case below

- `x_value` is **global** to the function `times_x`
- `new_value` and `input_value` are **local** to the function `times_x`
 - referring to `new_value` or `input_value` from outside the definition of `times_x` would result in an error

```
x_value <- 10
times_x <- function (input_value) {
  new_value <- input_value * x_value
  new_value
}
times_x(2)

## [1] 20
```

6.9 Summary

Functions

- Defining functions
- Scope of a variable

Next: Practical session

- Conditional statements
- Loops
 - While
 - For
- Functions
 - Loading functions from scripts
- Debugging

Chapter 7

Data Frames

7.1 Recap

Prev: R programming

- 111 Lecture: Data types
- 112 Lecture: Control structures
- 113 Lecture: Functions
- 114 Practical session

Now: Data Frames

- Data Frames
- Tibbles

7.1.1 Data Frames

A **data frame** is equivalent to a *named list* where all elements are *vectors of the same length*.

```
employees <- data.frame(  
  Name = c("Maria", "Pete", "Sarah"),  
  Age = c(47, 34, 32),  
  Role = c("Professor", "Researcher", "Researcher"))  
employees
```

```
##      Name Age      Role
```

```
## 1 Maria 47 Professor
## 2 Pete 34 Researcher
## 3 Sarah 32 Researcher
```

Data frames are the most common way to represent tabular data in R. Matrices and lists can be converted to data frames.

7.2 Selection

Selection is similar to vectors and lists.

```
employees[1, ] # row selection

##      Name Age      Role
## 1 Maria 47 Professor

employees[, 1] # column selection, as for matrices

## [1] "Maria" "Pete"  "Sarah"
```

7.3 Selection

Selection is similar to vectors and lists.

```
employees$Name # column selection, as for named lists

## [1] "Maria" "Pete"  "Sarah"

employees$Name[1]

## [1] "Maria"
```

7.4 Value assignment

Values can be assigned to cells through filtering and <-

```
employees$Age[3] <- 33
employees

##   Name Age      Role
## 1 Maria 47 Professor
## 2 Pete  34 Researcher
## 3 Sarah 33 Researcher
```

7.5 Column processing

Operations can be performed on columns, and new columns created.

```
current_year <- as.integer(format(Sys.Date(), "%Y"))
employees$Year_of_birth <- current_year - employees$Age
employees

##   Name Age      Role Year_of_birth
## 1 Maria 47 Professor        1973
## 2 Pete  34 Researcher      1986
## 3 Sarah 33 Researcher      1987
```

7.6 tibble

A tibble is a modern reimagining of the data.frame within `tidyverse`

- they do less
 - don't change variable names or types
 - don't do partial matching
- complain more
 - e.g. when a variable does not exist

This forces you to confront problems earlier, typically leading to cleaner, more expressive code.

7.7 Summary

Data Frames

- Data Frames
- Tibbles

Next: Data selection and filtering

- dplyr
- dplyr::select
- dplyr::filter

Chapter 8

Selection and filtering

8.1 Recap

Prev: Data Frames

- Data Frames
- Tibbles

Now: Data selection and filtering

- dplyr
- dplyr::select
- dplyr::filter

8.2 dplyr

The `dplyr` (pronounced *dee-ply-er*) library is part of `tidyverse` and it offers a grammar for data manipulation

- `select`: select specific columns
- `filter`: select specific rows
- `arrange`: arrange rows in a particular order
- `summarise`: calculate aggregated values (e.g., mean, max, etc)
- `group_by`: group data based on common column values
- `mutate`: add columns
- `join`: merge data frames

```
library(tidyverse)
```

8.3 Example dataset

The library `nycflights13` contains a dataset storing data about all the flights departed from New York City in 2013

```
install.packages("nycflights13")

library(nycflights13)

## Warning: package 'nycflights13' was built under R version 4.0.2

flights_from_nyc <- nycflights13::flights

colnames(flights_from_nyc)

##  [1] "year"          "month"         "day"           "dep_time"
##  [5] "sched_dep_time" "dep_delay"      "arr_time"       "sched_arr_time"
##  [9] "arr_delay"      "carrier"        "flight"        "tailnum"
## [13] "origin"         "dest"          "air_time"       "distance"
## [17] "hour"           "minute"        "time_hour"
```

8.4 dplyr::select

`select` can be used to specify which columns to retain

```
delays <- select(flights_from_nyc,
  origin, dest, dep_delay, arr_delay,
  year:day
  )

# Drop column arr_delay using - in front of the column name
dep_delays <- select(delays, -arr_delay)

delays[1:3, ]
```

```
## # A tibble: 3 x 7
##   origin dest  dep_delay arr_delay year month   day
##   <chr>   <chr>     <dbl>     <dbl> <dbl> <dbl> <dbl>
```

```
##   <chr>  <chr>    <dbl>    <dbl> <int> <int> <int>
## 1 EWR    IAH        2        11  2013     1     1
## 2 LGA    IAH        4        20  2013     1     1
## 3 JFK    MIA        2        33  2013     1     1
```

8.5 dplyr::select

... using the pipe operator

```
dep_delays <- flights_from_nyc %>%
  select(origin, dest, dep_delay, arr_delay, year:day) %>%
  select(-arr_delay)

delays[1:3, ]
```

```
## # A tibble: 3 x 7
##   origin dest  dep_delay arr_delay year month   day
##   <chr>  <chr>    <dbl>    <dbl> <int> <int> <int>
## 1 EWR    IAH        2        11  2013     1     1
## 2 LGA    IAH        4        20  2013     1     1
## 3 JFK    MIA        2        33  2013     1     1
```

8.6 Logical filtering

Conditional statements can be used to filter a vector, i.e. to retain only certain values

```
a_numeric_vector <- -3:3
a_numeric_vector
```

```
## [1] -3 -2 -1  0  1  2  3
```

```
a_numeric_vector[c(FALSE, FALSE, FALSE, TRUE, TRUE, TRUE, TRUE)]
```

```
## [1] 0 1 2 3
```

8.7 Conditional filtering

As a condition expression results in a logic vector, that condition can be used for filtering

```
a_numeric_vector > 0

## [1] FALSE FALSE FALSE FALSE  TRUE  TRUE  TRUE

a_numeric_vector[a_numeric_vector > 0]

## [1] 1 2 3
```

8.8 Filtering data frames

The same can be applied to data frames

```
nov_dep_delays <- dep_delays[dep_delays$month == 11, ]

nov_dep_delays[1:3, ]

## # A tibble: 3 x 6
##   origin dest  dep_delay year month   day
##   <chr>   <chr>     <dbl> <int> <int> <int>
## 1 JFK     PSE        6  2013    11      1
## 2 JFK     SYR       105 2013    11      1
## 3 EWR     CLT       -5  2013    11      1
```

8.9 dplyr::filter

```
nov_dep_delays <- dep_delays %>%
  filter(month == 11) # Flights in November

nov_dep_delays[1:3, ]

## # A tibble: 3 x 6
##   origin dest  dep_delay year month   day
##   <chr>   <chr>     <dbl> <int> <int> <int>
## 1 JFK     PSE        6  2013    11      1
## 2 JFK     SYR       105 2013    11      1
## 3 EWR     CLT       -5  2013    11      1
```

8.10 Summary

Data selection and filtering

- dplyr
- dplyr::select
- dplyr::filter

Next:

Chapter 9

Data manipulation

9.1 Recap

Prev: Data selection and filtering

- `dplyr`
- `dplyr::select`
- `dplyr::filter`

Now: Data manipulation

- `dplyr::arrange`
- `dplyr::summarise`
- `dplyr::group_by`
- `dplyr::mutate`

9.2 `dplyr`

The `dplyr` (pronounced *dee-ply-er*) library is part of `tidyverse` and it offers a grammar for data manipulation

- `select`: select specific columns
- `filter`: select specific rows
- `arrange`: arrange rows in a particular order
- `summarise`: calculate aggregated values (e.g., mean, max, etc)
- `group_by`: group data based on common column values
- `mutate`: add columns
- `join`: merge data frames

9.3 Libraries

```
library(tidyverse)
library(nycflights13)

nov_dep_delays <-
  nycflights13::flights %>%
  select(origin, dest, dep_delay, arr_delay, year:day) %>%
  select(-arr_delay) %>%
  filter(month == 11)
```

9.4 dplyr::arrange

```
nov_dep_delays <- nov_dep_delays %>%
  arrange(
    dest, # Ascending destination name
    -dep_delay # Descending delay
  )

nov_dep_delays[1:3, ]

## # A tibble: 3 x 6
##   origin dest  dep_delay  year month   day
##   <chr>   <chr>     <dbl> <int> <int> <int>
## 1 JFK     ABQ        25  2013    11    29
## 2 JFK     ABQ        21  2013    11    22
## 3 JFK     ABQ        17  2013    11    21
```

9.5 dplyr::summarise

`summarise`: calculate aggregated values (e.g., mean, max, etc)

```
aggr_dep_delays_nov <- nov_dep_delays %>%
  # Need to filter out rows where delay is NA
  filter(!is.na(dep_delay)) %>%
  # Create two aggregated columns
  summarize(
    avg_dep_delay = mean(dep_delay),
    tot_dep_delay = sum(dep_delay)
```

```

)
aggr_dep_delays_nov

## # A tibble: 1 x 2
##   avg_dep_delay tot_dep_delay
##       <dbl>        <dbl>
## 1      5.44     146945

```

9.6 dplyr::group_by

```

dest_dep_delays_nov <- nov_dep_delays %>%
  # Need to filter out rows where delay is NA
  filter(!is.na(dep_delay)) %>%
  # First group by same destination
  group_by(dest) %>%
  # Then calculate aggregated value
  summarise(
    tot_dep_delay = sum(dep_delay)
  )

## `summarise()` ungrouping output (override with `.`groups` argument)

dest_dep_delays_nov[1:3, ]

## # A tibble: 3 x 2
##   dest  tot_dep_delay
##   <chr>      <dbl>
## 1 ABQ        -66
## 2 ALB         636
## 3 ATL        8184

```

9.7 dplyr::mutate

```

dest_dep_delays_nov <- dest_dep_delays_nov %>%
  mutate(
    tot_dep_delay_days = ((tot_dep_delay / 60) / 24)
  )

dest_dep_delays_nov[1:3, ]

```

```
## # A tibble: 3 x 3
##   dest  tot_dep_delay tot_dep_delay_days
##   <chr>     <dbl>            <dbl>
## 1 ABQ        -66       -0.0458
## 2 ALB        636        0.442 
## 3 ATL       8184        5.68
```

9.8 Full pipe example

```
dest_dep_delays_nov <- nycflights13::flights %>%
  select(origin, dest, dep_delay, arr_delay, year:day) %>%
  select(-arr_delay) %>%
  filter(month == 11) %>%
  filter(!is.na(dep_delay)) %>%
  arrange(dest, -dep_delay) %>%
  group_by(dest) %>%
  summarise(tot_dep_delay = sum(dep_delay)) %>%
  mutate(tot_dep_delay_days = ((tot_dep_delay / 60) / 24))

## 1 ABQ        -66       -0.0458
## 2 ALB        636        0.442 
## 3 ATL       8184        5.68
```

9.9 Summary

Data manipulation

- dplyr::arrange
- dplyr::summarise
- dplyr::group_by
- dplyr::mutate

Next: Practical session

- Creating R projects
- Creating R scripts
- Data wrangling script

Chapter 10

Join operations

10.1 Recap

Prev: Selection and manipulation

- Data Frames
- Data selection and filtering
- Data manipulation

Now: Join operations

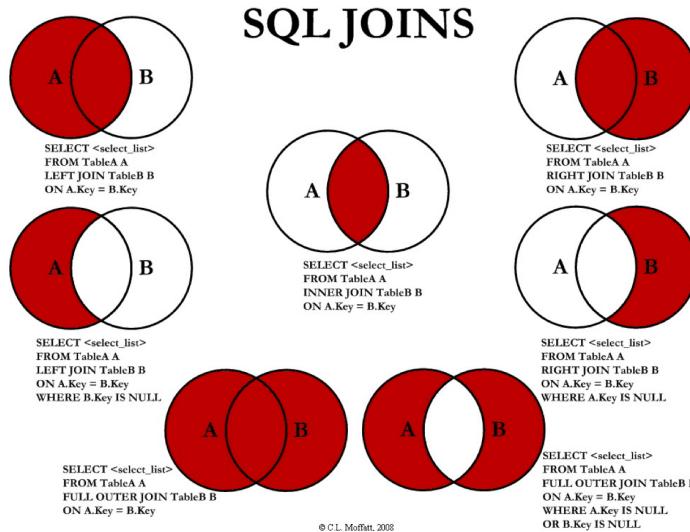

- Joining data
- dplyr join functions

10.2 Joining data

Data frames can be joined (or ‘merged’)

- information from two data frames can be combined
- specifying a **column with common values**
 - usually one with a unique identifier of an entity
- rows having the same value are joined
- depending on parameters
 - a row from one data frame can be merged with multiple rows from the other data frame
 - rows with no matching values in the other data frame can be retained
- `merge` base function or join functions in `dplyr`

10.3 Join types

by C.L. Moffatt, licensed under The Code Project Open License (CPOL)

10.4 Example

```
employees <- data.frame(
  Name = c("Maria", "Pete", "Sarah", "Jo"),
  Age = c(47, 34, 32, 25),
  Role = c("Professor", "Researcher", "Researcher", "Postgrad")
)

city_of_birth <- data.frame(
  Name = c("Maria", "Pete", "Sarah", "Mel"),
  City = c("Barcelona", "London", "Boston", "Los Angeles")
)
```

10.5 Example

Name	Age	Role
Maria	47	Professor
Pete	34	Researcher
Sarah	32	Researcher
Jo	25	Postgrad

Name	City
Maria	Barcelona
Pete	London
Sarah	Boston
Mel	Los Angeles

10.6 dplyr::full_join

dplyr provides a series of join functions

- `full_join` combines all the available data

```
employees %>% full_join(
  city_of_birth,
  by = c("Name" = "Name") # join columns
) %>%
  kable()
```

Name	Age	Role	City
Maria	47	Professor	Barcelona
Pete	34	Researcher	London
Sarah	32	Researcher	Boston
Jo	25	Postgrad	NA
Mel	NA	NA	Los Angeles

10.7 dplyr::left_join

- `left_join` keeps all the data from the **left** table
 - using `%>%`, that's the data “*coming down the pipe*”
- rows from the right table without a match are dropped

```
employees %>% left_join(
  city_of_birth,
  by = c("Name" = "Name") # join columns
) %>%
  kable()
```

Name	Age	Role	City
Maria	47	Professor	Barcelona
Pete	34	Researcher	London
Sarah	32	Researcher	Boston
Jo	25	Postgrad	NA

10.8 dplyr::right_join

- `right_join` keeps all the data from the `right` table
 - using `%>%`, that's the data provided as an argument
- rows from the left table without a match are dropped

```
employees %>% right_join(
  city_of_birth,
  by = c("Name" = "Name") # join columns
) %>%
  kable()
```

Name	Age	Role	City
Maria	47	Professor	Barcelona
Pete	34	Researcher	London
Sarah	32	Researcher	Boston
Mel	NA	NA	Los Angeles

10.9 dplyr::inner_join

- `inner_join` keeps only rows that have a match in both tables
- rows without a match are dropped

```
employees %>% inner_join(
  city_of_birth,
  by = c("Name" = "Name") # join columns
) %>%
  kable()
```

Name	Age	Role	City
Maria	47	Professor	Barcelona
Pete	34	Researcher	London
Sarah	32	Researcher	Boston

10.10 Summary

Join operations

- Joining data
- dplyr join functions

Next: Table pivot

Chapter 11

Data pivot

11.1 Recap

Prev: Selection and manipulation

- Data Frames
- Data selection and filtering
- Data manipulation

Now: Data pivot

- Wide and long data
- `tidy::pivot_longer`
- `tidy::pivot_wider`

11.2 Wide data

This is the most common approach

- each real-world entity is represented by *one single row*
- its attributes are represented through different columns

City	Population	Area	Density
Leicester	329,839	73.3	4,500
Nottingham	321,500	74.6	4,412

11.3 Long data

This is probably a less common approach, but still necessary in many cases

- each real-world entity is represented by *multiple rows*
 - each one reporting only one of its attributes
- one column indicates which attribute each row represent
- another column is used to report the value

City	Attribute	Value
Leicester	Population	329,839
Leicester	Area	73.3
Leicester	Density	4,500
Nottingham	Population	321,500
Nottingham	Area	74.6
Nottingham	Density	4,412

11.4 Libraries

```
library(tidyverse)

## -- Attaching packages -----
## v ggplot2 3.3.2     v purrr   0.3.4
## v tibble  3.0.3     v dplyr    1.0.0
## v tidyverse 1.1.0    v stringr  1.4.0
## v readr   1.3.1     vforcats 0.5.0

## -- Conflicts -----
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()   masks stats::lag()

library(knitr)
```

11.5 tidyverse

The `tidyverse` (pronounced *tidy-er*) library is part of `tidyverse` and it provides functions to re-shape your data

```
city_info_wide <- data.frame(
  City = c("Leicester", "Nottingham"),
  Population = c(329839, 321500),
  Area = c(73.3, 74.6),
  Density = c(4500, 4412)
)

kable(city_info_wide)
```

City	Population	Area	Density
Leicester	329839	73.3	4500
Nottingham	321500	74.6	4412

11.6 tidyrm::gather

Re-shape from *wide* to *long* format

```
city_info_long <- city_info_wide %>%
  gather(
    -City, # exclude city names from gathering
    key = "Attribute", # name for the new key column
    value = "Value" # name for the new value column
  )
```

City	Attribute	Value
Leicester	Population	329839.0
Nottingham	Population	321500.0
Leicester	Area	73.3
Nottingham	Area	74.6
Leicester	Density	4500.0
Nottingham	Density	4412.0

11.7 tidyrm::spread

Re-shape from *long* to *wide* format

```
city_info_back_to_wide <- city_info_long %>%
  spread(
    key = "Attribute", # specify key column
    value = "Value" # specify value column
  )
```

City	Area	Density	Population
Leicester	73.3	4500	329839
Nottingham	74.6	4412	321500

11.8 Summary

Table pivot

- Wide and long data
- `tidyr::pivot_longer`
- `tidyr::pivot_wider`

Next: Read and write data

Chapter 12

Read and write data

12.1 Summary

Table pivot

- Wide and long data
- `tidy::pivot_longer`
- `tidy::pivot_wider`

Next: Read and write data

- file formats
- read
- write

12.2 Comma Separated Values

The file `2011_OAC_Raw_uVariables_Leicester.csv` - contains data used for the 2011 Output Area Classification - 167 variables, as well as the resulting groups - for the city of Leicester

Extract showing only some columns

```
OA11CD,LSOA11CD, ... supgrpcode,supgrpname,Total_Population, ...
E00069517,E01013785, ... 6,Suburbanites,313, ...
E00169516,E01013713, ... 4,Multicultural Metropolitans,341, ...
E00169048,E01032862, ... 4,Multicultural Metropolitans,345, ...
```

The full variable names can be found in the file - `2011_OAC_Raw_uVariables_Lookup.csv`.

12.3 Libraries

```
library(tidyverse)

## -- Attaching packages ----

## v ggplot2 3.3.2      v purrr   0.3.4
## v tibble   3.0.3      v dplyr    1.0.0
## v tidyverse 1.1.0     v stringr  1.4.0
## v readr    1.3.1      vforcats  0.5.0

## -- Conflicts --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()   masks stats::lag()

library(knitr)
```

12.4 Read

The `read_csv` function of the `readr` library reads a *csv* file from the path provided as the first argument

```
leicester_2011OAC <- read_csv("2011_OAC_Raw_uVariables_Leicester.csv")

leicester_2011OAC %>%
  select(OA11CD, LSOA11CD, supgrpcode, supgrpname, Total_Population) %>%
  top_n(3) %>%
  kable()
```

OA11CD	LSOA11CD	supgrpcode	supgrpname	Total_Population
E00169553	E01013648	2	Cosmopolitans	714
E00069303	E01013739	4	Multicultural Metropolitans	623
E00168096	E01013689	2	Cosmopolitans	708

12.5 Write

The function `write_csv` can be used to save a dataset to *csv*

Example:

1. **read** the 2011 OAC dataset
2. **select** a few columns
3. **filter** only those OA in the supergroup *Suburbanites* (code 6)
4. **write** the results to a file named *Leicester_Suburbanites.csv* in your home folder

```
read_csv("2011_OAC_Raw_uVariables_Leicester.csv") %>%
  select(OA11CD, supgrpcode, supgrpname) %>%
  filter(supgrpcode == 6) %>%
  write_csv("~/Leicester_Suburbanites.csv")
```

12.6 Summary

Chapter 13

Reproducibility

13.1 Recap

Prev: Table operations

- 211 Join operations
- 212 Data pivot
- 213 Read and write data
- 214 Practical session

Now: Reproduciblity

- Reproduciblity and software engineering
- Reproduciblity in GIScience
- Guidelines

13.2 Reproduciblity

In quantitative research, an analysis or project are considered to be **reproducible** if:

- “*the data and code used to make a finding are available and they are sufficient for an independent researcher to recreate the finding.*” Christopher Gandrud, *Reproducible Research with R and R Studio*

That is becoming more and more important in science:

- as programming and scripting are becoming integral in most disciplines
- as the amount of data increases

13.3 Why?

In scientific research:

- verifiability of claims through replication
- incremental work, avoid duplication

For your working practice:

- better working practices
 - coding
 - project structure
 - versioning
- better teamwork
- higher impact (not just results, but code, data, etc.)

13.4 Reproducibility and software engineering

Core aspects of **software engineering** are:

- project design
- software **readability**
- testing
- **versioning**

As programming becomes integral to research, similar necessities arise among scientists and data analysts.

13.5 Reproducibility and “big data”

There has been a lot of discussions about “**big data**”...

- volume, velocity, variety, ...

Beyond the hype of the moment, as the **amount** and **complexity** of data increases

- the time required to replicate an analysis using point-and-click software becomes unsustainable
- room for error increases

Workflow management software (e.g., ArcGIS ModelBuilder) is one answer, reproducible data analysis based on script languages like R is another.

13.6 Reproducibility in GIScience

Singleton *et al.* have discussed the issue of reproducibility in GIScience, identifying the following best practices:

1. Data should be accessible within the public domain and available to researchers.
2. Software used should have open code and be scrutable.
3. Workflows should be public and link data, software, methods of analysis and presentation with discursive narrative
4. The peer review process and academic publishing should require submission of a workflow model and ideally open archiving of those materials necessary for replication.
5. Where full reproducibility is not possible (commercial software or sensitive data) aim to adopt aspects attainable within circumstances

13.7 Document everything

In order to be reproducible, every step of your project should be documented in detail

- data gathering
- data analysis
- results presentation

Well documented R scripts are an excellent way to document your project.

13.8 Document well

Create code that can be **easily understandable** to someone outside your project, including yourself in six-month time!

- use a style guide (e.g. tidyverse) consistently
- add a **comment** at the beginning of a file, including
 - date
 - contributors
 - other files the current file depends on
 - materials, sources and other references
- add a **comment** before each code block, describing what the code does
- also add a **comment** before any line that could be ambiguous or particularly difficult or important

13.9 Workflow

Relationships between files in a project are not simple:

- in which order are file executed?
- when to copy files from one folder to another, and where?

A common solution is using **make files**

- commonly written in *bash* on Linux systems
- they can be written in R, using commands like
 - *source* to execute R scripts
 - *system* to interact with the operative system

13.10 Future-proof formats

Complex formats (e.g., .docx, .xlsx, .shp, ArcGIS .mxd)

- can become obsolete
- are not always portable
- usually require proprietary software

Use the simplest format to **future-proof** your analysis. **Text files** are the most versatile

- data: .txt, .csv, .tsv
- analysis: R scripts, python scripts
- write-up: LaTeX, Markdown, HTML

13.11 Store and share

Reproducible data analysis is particularly important when working in teams, to share and communicate your work.

- Dropbox
 - good option to work in teams, initially free
 - no versioning, branches
- Git

- free and opensource control system
- great to work in teams and share your work publically
- can be more difficult at first
- GitHub public repositories are free, private ones are not
- GitLab offers free private repositories

13.12 This repository

A screenshot of a GitHub repository page. The repository name is `sdesabbata/granolarr`. The page displays a list of 27 commits. The commits include:

- `Data`: Imported materials from GY7702 (2 months ago)
- `Exercises`: Added materials on regression and machine learning from GY7702 (4 days ago)
- `Lectures`: Minor edit (yesterday)
- `Practicals`: Minor edit (yesterday)
- `Utils`: Updated images and related READMEs (2 days ago)
- `gitattributes`: Added gitattributes (2 months ago)
- `gitignore`: Imported materials from GY7702 (2 months ago)
- `LICENSE`: Initial commit (2 months ago)
- `Make.R`: Added materials on regression and machine learning from GY7702 (4 days ago)
- `Make.Clean.R`: Imported materials from GY7702 (2 months ago)
- `README.md`: Minor edit (yesterday)
- `config.yml`: Set theme jekyll-theme-cayman (2 months ago)
- `granolarr.Rproj`: Created R project (2 months ago)

Chapter 14

RMarkdown

14.1 Recap

Prev: Reproducibility

- Reproducibility and software engineering
- Reproducibility in GIScience
- Guidelines

Now: RMarkdown

- Markdown
- RMarkdown

14.2 Markdown

Markdown is a simple markup language

- allows to mark-up plain text
- to specify more complex features (such as *italics text*)
- using a very simple syntax

Markdown can be used in conjunction with numerous tools

- to produce HTML pages
- or even more complex formats (such as PDF)

These slides are written in Markdown

14.3 Markdown example code

```
### This is a third level heading

Text can be specified as *italic* or **bold**

- and list can be created
  - very simply

1. also numbered lists
  1. [add a link like this](http://le.ac.uk)
```

Tables	Can	Be
a bit	complicated	at first
but	it gets	easier

14.4 Markdown example output

14.4.1 This is a third level heading

Text can be specified as *italic* or **bold**

- and list can be created
 - very simply
1. also numbered lists
 1. add a link like this

Tables	Can	Be
a bit	complicated	at first
but	it gets	easier

14.5 RMarkdown example code

Let's write an example of ****R**** code including

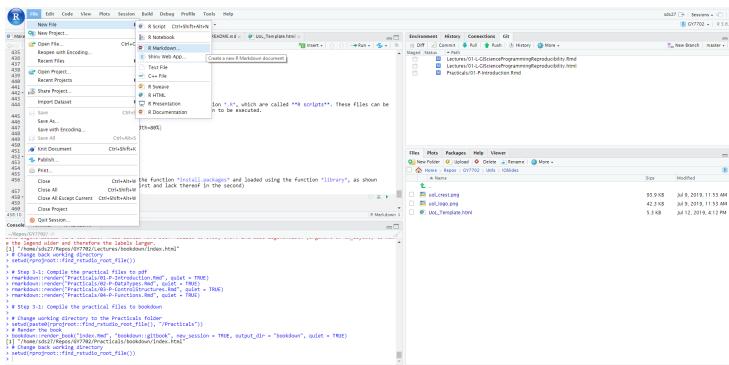

- a variable `a_variable`
- an assignment operation (i.e., `<-`)

- a mathematical operation (i.e., `+`)

```
```{r, echo=TRUE}
a_variable <- 0
a_variable <- a_variable + 1
a_variable <- a_variable + 1
a_variable <- a_variable + 1
a_variable
```
```

14.6 Writing RMarkdown docs

RMarkdown documents contain both Markdown and R code. These files can be created in RStudio, and compiled to create an html page (like this document), a pdf, or a Microsoft Word document.

14.7 Summary

RMarkdown

Chapter 15

Git

15.1 Recap

RMarkdown

- Markdown
- RMarkdown

Next: Git

- Git operations
- Git and RStudio

15.2 What's git?

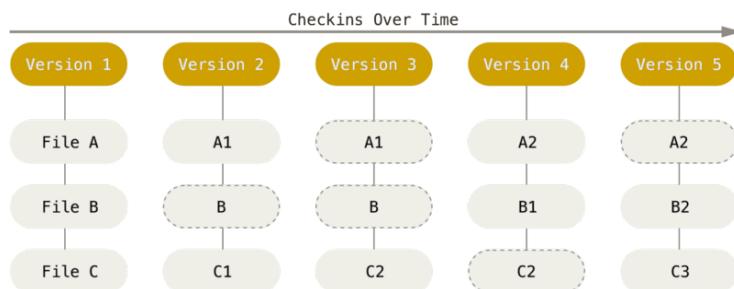

Git is a free and opensource version control system

- commonly used through a server
 - where a master copy of a project is kept
 - can also be used locally
- allows storing versions of a project
 - syncronisation
 - consistency
 - history
 - multiple branches

15.3 How git works

A series of snapshots

- each commit is a snapshot of all files
- if no change to a file, link to previous commit
- all history stored locally

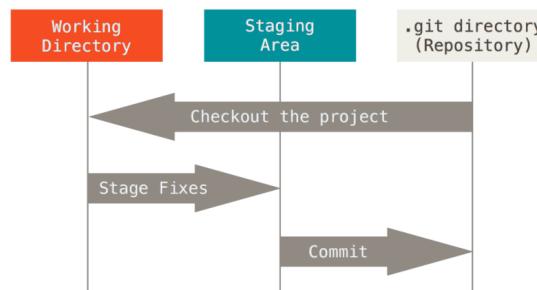

by Scott Chacon and Ben Straub, licensed under CC BY-NC-SA 3.0

15.4 Three stages

When working with a git repository

- first checkout the latest version
- select the edits to stage
- commit what has been staged in a permanent snapshot

by Scott Chacon and Ben Straub, licensed under CC BY-NC-SA 3.0

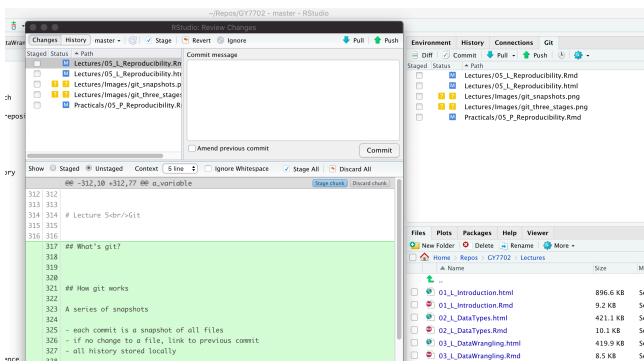

15.5 Basic git commands

- **git clone**
 - copy a repository from a server
- **git fetch**
 - get the latest version from a branch
- **git pull**
 - incorporate changes from a remote repository
- **git add**
 - stage new files
- **git commit**
 - create a commit
- **git push**
 - upload commits to a remote repository

15.6 Git and RStudio

RStudio includes a git plug-in

- clone R projects from repositories
- stage and commit changes
- push and pull changes

15.7 Summary

Git

- Git operations

Chapter 16

Data visualisation

16.1 Recap

Prev: Reproducibility

- 221 Reproducibility
- 222 R and Markdown
- 223 Git
- 224 Practical session

Now: Data visualisation

- Grammar of graphics
- ggplot2

16.2 Visual variables

A **visual variable** is an aspect of a **mark** that can be controlled to change its appearance.

Visual variables include:

- Size
- Shape
- Orientation
- Colour (hue)
- Colour value (brightness)
- Texture
- Position (2 dimensions)

16.3 Grammar of graphics

Grammars provide rules for languages

“The grammar of graphics takes us beyond a limited set of charts (words) to an almost unlimited world of graphical forms (statements)” (Wilkinson, 2005)

Statistical graphic specifications are expressed in six statements:

1. **Data** manipulation
2. **Variable** transformations (e.g., rank),
3. **Scale** transformations (e.g., log),
4. **Coordinate system** transformations (e.g., polar),
5. **Element**: mark (e.g., points) and visual variables (e.g., color)
6. **Guides** (axes, legends, etc.).

16.4 ggplot2

The `ggplot2` library offers a series of functions for creating graphics **declaratively**, based on the Grammar of Graphics.

To create a graph in `ggplot2`:

- provide the data
- specify elements
 - which visual variables (`aes`)
 - which marks (e.g., `geom_point`)
- apply transformations
- guides

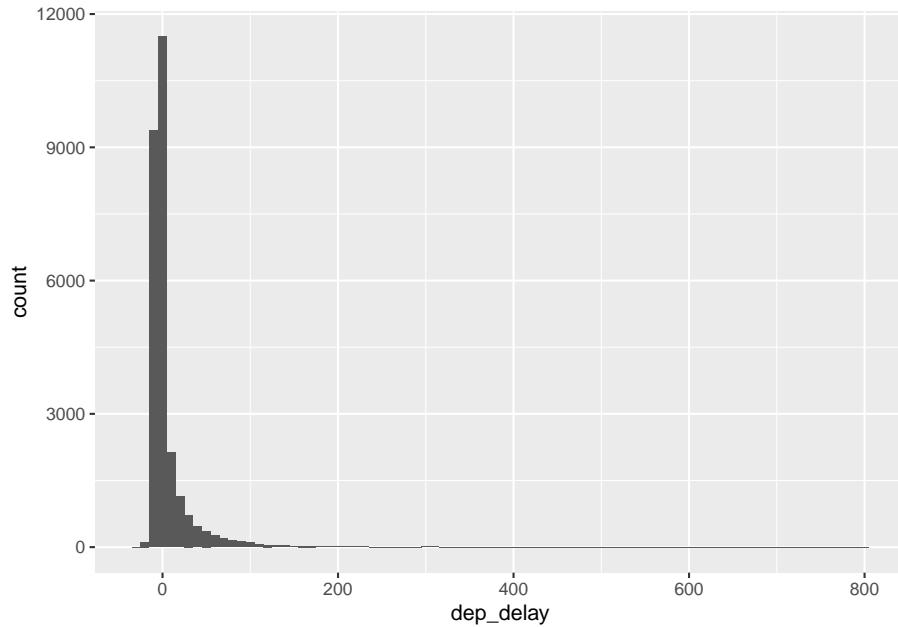

```
library(tidyverse)
library(nycflights13)
library(knitr)
```

16.5 Histograms

- `x` variable to plot
- `geom_histogram`

```
nycflights13::flights %>%
  filter(month == 11) %>%
  ggplot(
    aes(
      x = dep_delay
    )
  ) +
  geom_histogram(
    binwidth = 10
  )
```

16.6 Histograms

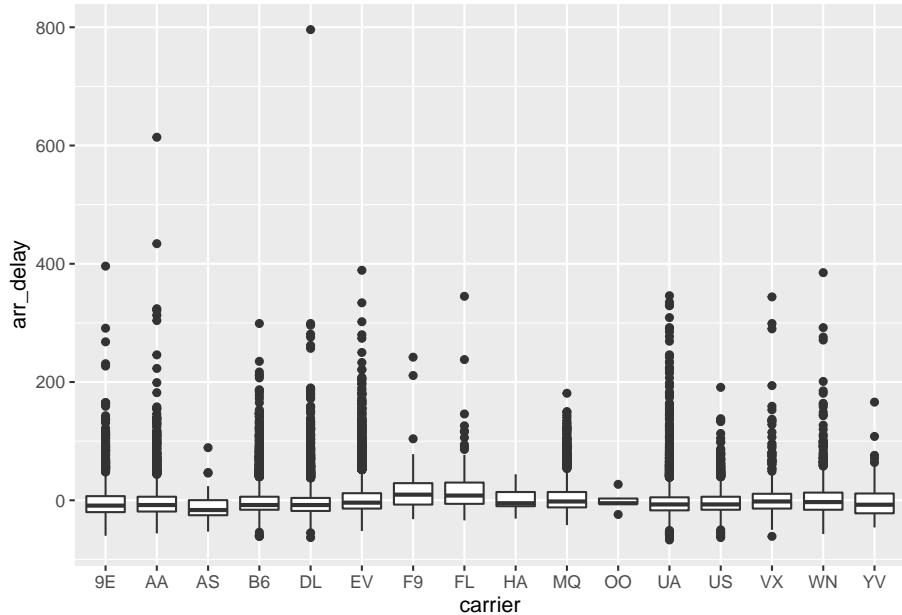

```
...:
nycflights13::flights %>%
  filter(month == 11) %>%
  ggplot(
    aes(
      x = distance
    )
  ) +
  geom_histogram() +
  scale_x_log10()
```

16.7 Boxplots

- x categorical variable
- y variable to plot
- geom_boxplot

```
nycflights13::flights %>%
  filter(month == 11) %>%
  ggplot(
    aes(
      x = carrier,
      y = arr_delay
    )
  ) +
  geom_boxplot()
```

16.8 Boxplots

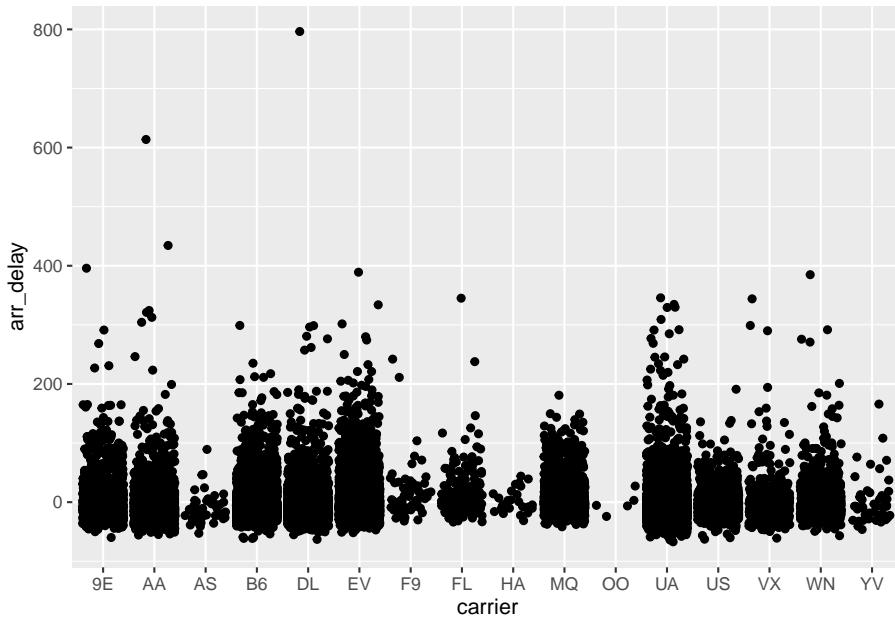

16.9 Jittered points

- x categorical variable

- y variable to plot
- `geom_jitter`

```
nycflights13::flights %>%
  filter(month == 11) %>%
  ggplot(
    aes(
      x = carrier,
      y = arr_delay
    )
  ) +
  geom_jitter()
```

16.10 Jittered points

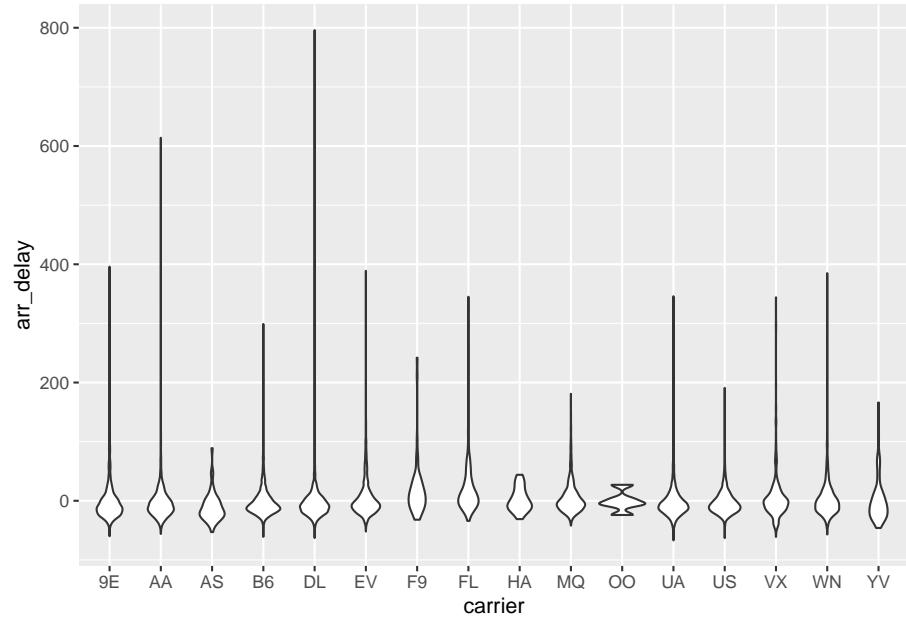

16.11 Violin plot

- x categorical variable
- y variable to plot
- `geom_violin`

```
nycflights13::flights %>%
  filter(month == 11) %>%
  ggplot(
    aes(
      x = carrier,
      y = arr_delay
    )
  ) +
  geom_violin()
```

16.12 Violin plot

16.13 Lines

- x e.g., a temporal variable
- y variable to plot
- `geom_line`

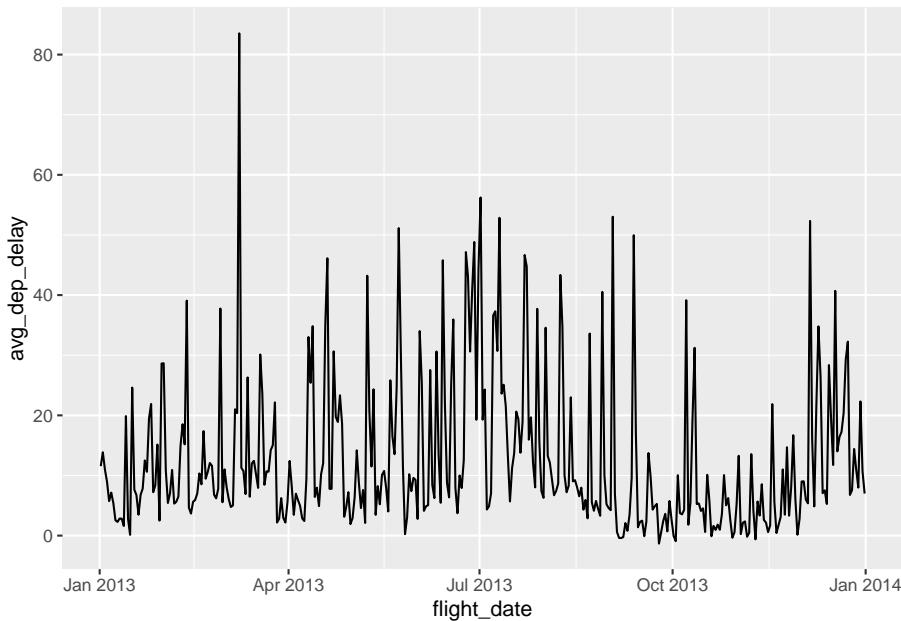

```
nycflights13::flights %>%
  filter(!is.na(dep_delay)) %>%
```

```

mutate(flight_date = ISOdate(year, month, day)) %>%
group_by(flight_date) %>%
summarize(avg_dep_delay = mean(dep_delay)) %>%
ggplot(aes(
  x = flight_date,
  y = avg_dep_delay
)) +
geom_line()

```

16.14 Lines

16.15 Scatterplots

- x and y variable to plot
- geom_point

```

nycflights13::flights %>%
filter(
  month == 11,
  carrier == "US",

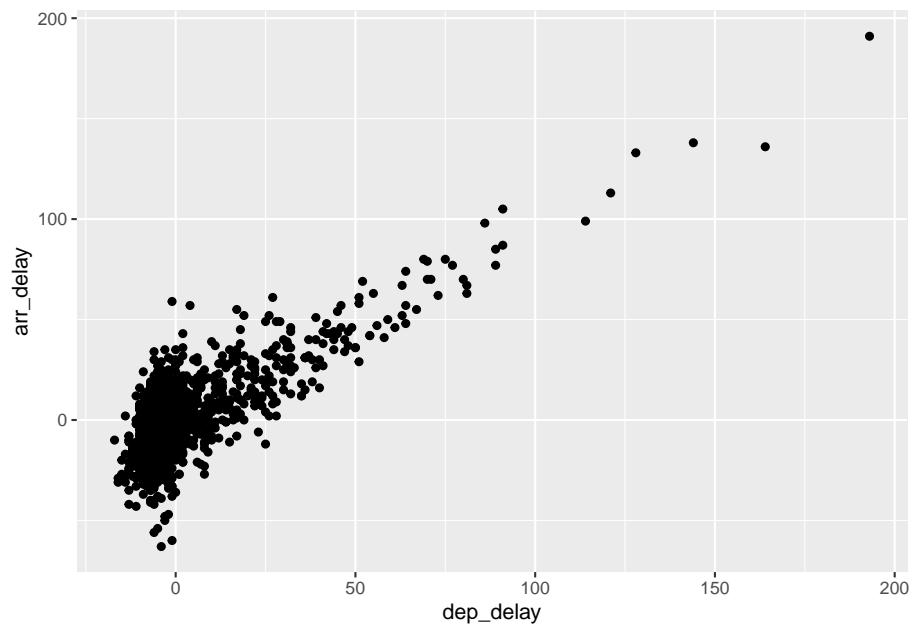

```

```

!is.na(dep_delay),
!is.na(arr_delay)
) %>%
ggplot(aes(
  x = dep_delay,
  y = arr_delay
)) +
geom_point()

```

16.16 Scatterplots

16.17 Overlapping points

- x and y variable to plot
- geom_count counts overlapping points and maps the count to size

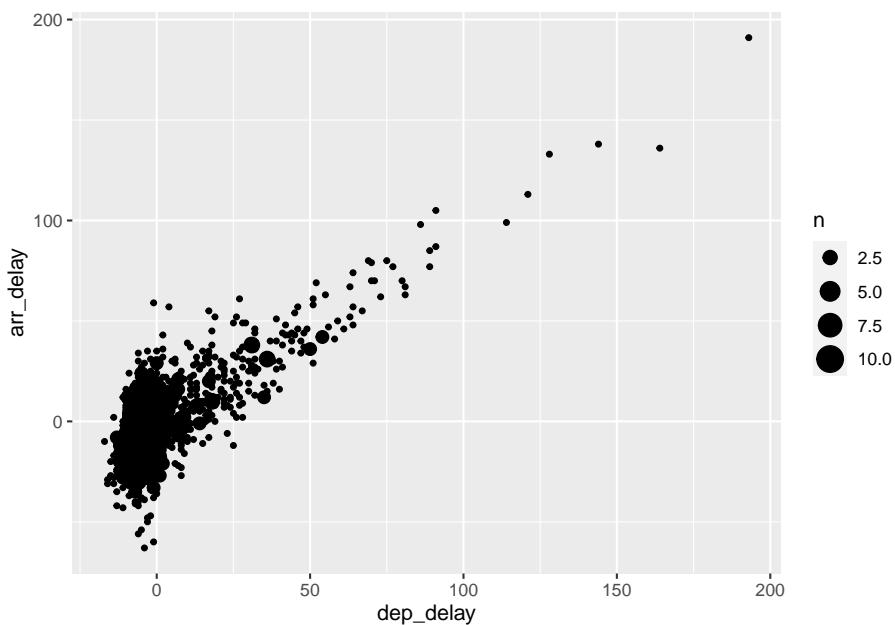

```

nycflights13::flights %>%
filter(
  month == 11, carrier == "US",
  !is.na(dep_delay), !is.na(arr_delay)
)

```

```
) %>%
ggplot(aes(
  x = dep_delay,
  y = arr_delay
)) +
geom_count()
```

16.18 Overlapping points

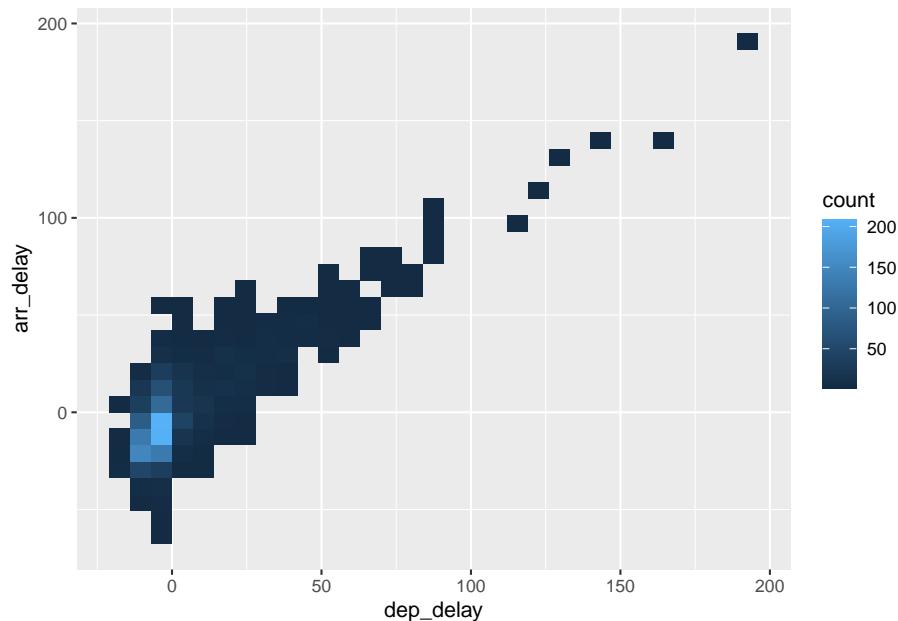

16.19 Bin counts

- x and y variable to plot
- geom_bin2d

```
nycflights13::flights %>%
filter(
  month == 11,
  carrier == "US",
  !is.na(dep_delay),
  !is.na(arr_delay)
```

```
) %>%  
  ggplot(aes(  
    x = dep_delay,  
    y = arr_delay  
) +  
  geom_bin2d()
```

16.20 Bin counts

16.21 Summary

Data visualisation

- Grammar of graphics
- ggplot2

Next: Descriptive statistics

- stat.desc
- dplyr::across

Chapter 17

Descriptive statistics

17.1 Summary

Data visualisation

- Grammar of graphics
- ggplot2

Next: Descriptive statistics

- stat.desc
- dplyr::across

17.2 Libraries and data

```
library(tidyverse)
library(magrittr)
library(knitr)

library(pastecs)

library(nycflights13)

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

17.3 Descriptive statistics

Quantitatively describe or summarize variables

- `stat.desc` from `pastecs` library
 - `base` includes counts
 - `desc` includes descriptive stats
 - `norm` (default is `FALSE`) includes distribution stats

```
nycflights13::flights %>%
  filter(month == 11, carrier == "US") %>%
  select(dep_delay, arr_delay, distance) %>%
  stat.desc() %>%
  kable()
```

17.4 `stat.desc` output

| | dep_delay | arr_delay | distance |
|--------------|--------------|--------------|--------------|
| nbr.val | 1668.0000000 | 1667.000000 | 1.699000e+03 |
| nbr.null | 58.0000000 | 35.000000 | 0.000000e+00 |

| coef.var | 28.9519850 | -7.935179 | 1.055963e+00 |

17.5 `stat.desc: basic`

- `nbr.val`: overall number of values in the dataset
- `nbr.null`: number of NULL values – NULL is often returned by expressions and functions whose values are undefined
- `nbr.na`: number of NAs – missing value indicator

17.6 stat.desc: desc

- `min` (also `min()`): **minimum** value in the dataset
- `max` (also `max()`): **minimum** value in the dataset
- `range`: difference between `min` and `max` (different from `range()`)
- `sum` (also `sum()`): sum of the values in the dataset
- `mean` (also `mean()`): **arithmetic mean**, that is `sum` over the number of values not `NA`
- `median` (also `median()`): **median**, that is the value separating the higher half from the lower half the values
- `mode()` function is available: `mode`, the value that appears most often in the values

17.7 Sample statistics

Assuming that the data in the dataset are a sample of a population

- `SE.mean`: **standard error of the mean** – estimation of the variability of the mean calculated on different samples of the data (see also *central limit theorem*)
- `CI.mean.0.95`: **95% confidence interval of the mean** – indicates that there is a 95% probability that the actual mean is within that distance from the sample mean

17.8 Estimating variation

- `var`: **variance** (σ^2), it quantifies the amount of variation as the average of squared distances from the mean

$$\sigma^2 = \frac{1}{n} \sum_{i=1}^n (\mu - x_i)^2$$

- `std.dev`: **standard deviation** (σ), it quantifies the amount of variation as the square root of the variance

$$\sigma = \sqrt{\frac{1}{n} \sum_{i=1}^n (\mu - x_i)^2}$$

- `coef.var`: **variation coefficient** it quantifies the amount of variation as the standard deviation divided by the mean

- Homogeneity of variance

18.2 Libraries and data

```
library(tidyverse)
library(magrittr)
library(knitr)

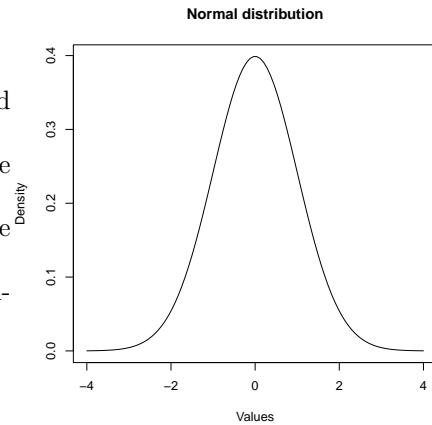

library(pastecs)

library(nycflights13)

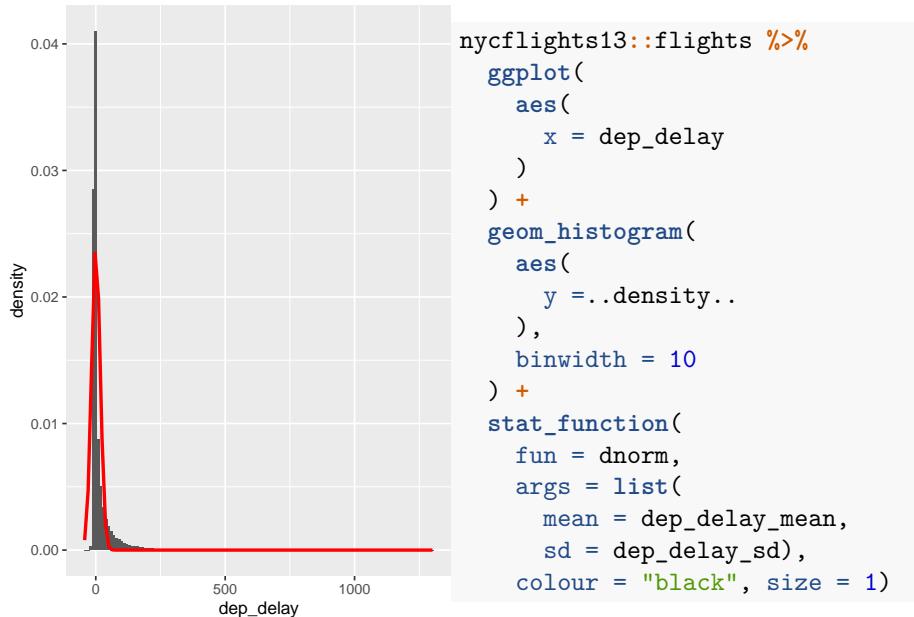

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

18.3 Normal distribution

- characterized by the bell-shaped curve
- majority of values lie around the centre of the distribution
- the further the values are from the centre, the lower their frequency
- about 95% of values within 2 standard deviations from the mean

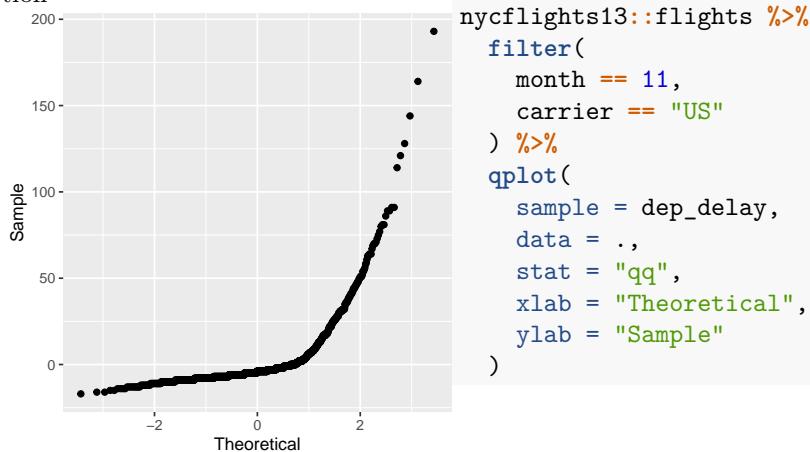

18.4 Density histogram

18.5 Q-Q plot

Cumulative values against the cumulative probability of a particular distribution

18.6 stat.desc: norm

```
nycflights13::flights %>%
  filter(month == 11, carrier == "US") %>%
  select(dep_delay, arr_delay, distance) %>%
  stat.desc(basic = FALSE, desc = FALSE, norm = TRUE) %>%
  kable()
```

| | dep_delay | arr_delay | distance |
|------------|-------------|------------|------------|
| skewness | 4.4187763 | 2.0716291 | 2.0030249 |
| skew.2SE | 36.8709612 | 17.2808242 | 16.8678747 |
| kurtosis | 28.8513206 | 9.5741004 | 2.6000743 |
| kurt.2SE | 120.4418092 | 39.9557893 | 10.9542887 |
| normtest.W | 0.5545326 | 0.8657894 | 0.6012442 |
| normtest.p | 0.0000000 | 0.0000000 | 0.0000000 |

18.7 Normality

Shapiro–Wilk test compares the distribution of a variable with a normal distribution having same mean and standard deviation

- If significant, the distribution is not normal

- `normtest.W` (test statistics) and `normtest.p` (significance)
- also, `shapiro.test` function is available

```
nycflights13::flights %>%
  filter(month == 11, carrier == "US") %>%
  pull(dep_delay) %>%
  shapiro.test()

##
##  Shapiro-Wilk normality test
##
## data: .
## W = 0.55453, p-value < 2.2e-16
```

18.8 Significance

Most statistical tests are based on the idea of hypothesis testing

- a **null hypothesis** is set
- the data are fit into a statistical model
- the model is assessed with a **test statistic**
- the **significance** is the probability of obtaining that test statistic value by chance

The threshold to accept or reject an hypothesis is arbitrary and based on conventions (e.g., $p < .01$ or $p < .05$)

Example: The null hypothesis of the Shapiro–Wilk test is that the sample is normally distributed and $p < .01$ indicates that the probability of that being true is very low.

18.9 Skewness and kurtosis

In a normal distribution, the values of *skewness* and *kurtosis* should be zero

- **skewness:** `skewness` value indicates
 - positive: the distribution is skewed towards the left
 - negative: the distribution is skewed towards the right
- **kurtosis:** `kurtosis` value indicates
 - positive: heavy-tailed distribution
 - negative: flat distribution
- **skew.2SE** and **kurt.2SE**: skewness and kurtosis divided by 2 standard errors. If greater than 1, the respective statistics is significant ($p < .05$).

18.10 Homogeneity of variance

Levene's test for equality of variance in different levels

- If significant, the variance is different in different levels

```
dep_delay_carrier <- nycflights13::flights %>%
  filter(month == 11) %>%
  select(dep_delay, carrier)

library(car)
leveneTest(dep_delay_carrier$dep_delay, dep_delay_carrier$carrier)

## Levene's Test for Homogeneity of Variance (center = median)
##          Df F value    Pr(>F)
## group     15 20.203 < 2.2e-16 ***
##        27019
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

18.11 Summary

Chapter 19

Comparing groups

19.1 Recap

Prev: Exploratory data analysis

- 301 Lecture Data visualisation
- 302 Lecture Descriptive statistics
- 303 Lecture Exploring assumptions
- 304 Practical session

Now: Comparing groups

- T-test
- ANOVA
- Chi-square

19.2 Libraries

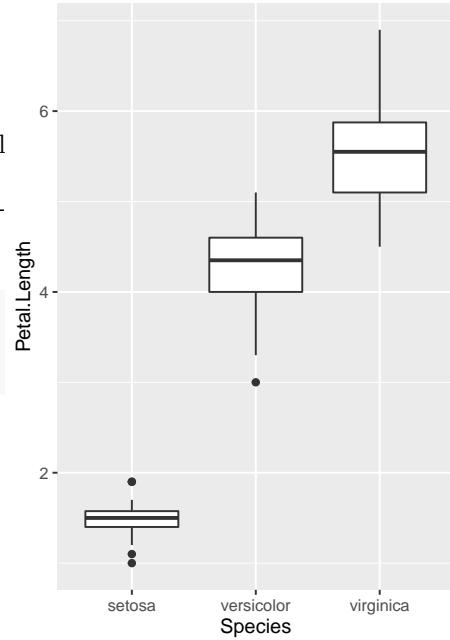

But let's start from a simple example from `datasets`

- 50 flowers from each of 3 species of iris

Today's libraries

- mostly working with the usual `nycflights13`
- exposition pipe `%$%` from the library `magrittr`

```
library(tidyverse)
library(magrittr)
library(nycflights13)
```

19.3 Example

```
iris %>% filter(Species == "setosa") %>% pull(Petal.Length) %>% shapiro.test()

##
## Shapiro-Wilk normality test
##
## data: .
## W = 0.95498, p-value = 0.05481

iris %>% filter(Species == "versicolor") %>% pull(Petal.Length) %>% shapiro.test()

##
## Shapiro-Wilk normality test
##
## data: .
## W = 0.966, p-value = 0.1585
```

```
iris %>% filter(Species == "virginica") %>% pull(Petal.Length) %>% shapiro.test()

## 
## Shapiro-Wilk normality test
##
## data: .
## W = 0.96219, p-value = 0.1098
```

19.4 T-test

Independent T-test tests whether two group means are different

$$\text{outcome}_i = (\text{group mean}) + \text{error}_i$$

- groups defined by a predictor, categorical variable
- outcome is a continuous variable
- assuming
 - normally distributed values in groups
 - homogeneity of variance of values in groups
 - * if groups have different sizes
 - independence of groups

19.5 Example

Values are normally distributed, groups have same size, and they are independent (different flowers, check using `leveneTest`)

```
iris %>%
  filter(Species %in% c("versicolor", "virginica")) %% # Note %%
  t.test(Petal.Length ~ Species)

## 
## Welch Two Sample t-test
##
## data: Petal.Length by Species
## t = -12.604, df = 95.57, p-value < 2.2e-16
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -1.49549 -1.08851
## sample estimates:
## mean in group versicolor mean in group virginica
##           4.260             5.552
```

The difference is significant $t(95.57) = -12.6, p < .01$

19.6 ANOVA

ANOVA (analysis of variance) tests whether more than two group means are different

$$\text{outcome}_i = (\text{group mean}) + \text{error}_i$$

- groups defined by a predictor, categorical variable
- outcome is a continuous variable
- assuming
 - normally distributed values in groups
 - * especially if groups have different sizes
 - homogeneity of variance of values in groups
 - * if groups have different sizes
 - independence of groups

19.7 Example

Values are normally distributed, groups have same size, they are independent (different flowers, check using `leveneTest`)

```
iris %$%
  aov(Petal.Length ~ Species) %>%
  summary()

##           Df Sum Sq Mean Sq F value Pr(>F)
## Species     2  437.1   218.55    1180 <2e-16 ***
## Residuals 147   27.2     0.19
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

The difference is significant $t(2, 147) = 1180.16, p < .01$

19.8 Summary

Comparing groups

- T-test
- ANOVA
- Chi-square

Next: Correlation

- Pearson's r
- Spearman's rho
- Kendall's tau
- Pairs plot

Chapter 20

Correlation

20.1 Recap

Prev: Comparing groups

- T-test
- ANOVA
- Chi-square

Now: Correlation

- Pearson's r
- Spearman's rho
- Kendall's tau
- Pairs plot

20.2 Correlation

Two variables can be related in three different ways

- related
 - positively: entities with high values in one tend to have high values in the other
 - negatively: entities with high values in one tend to have low values in the other
- not related at all

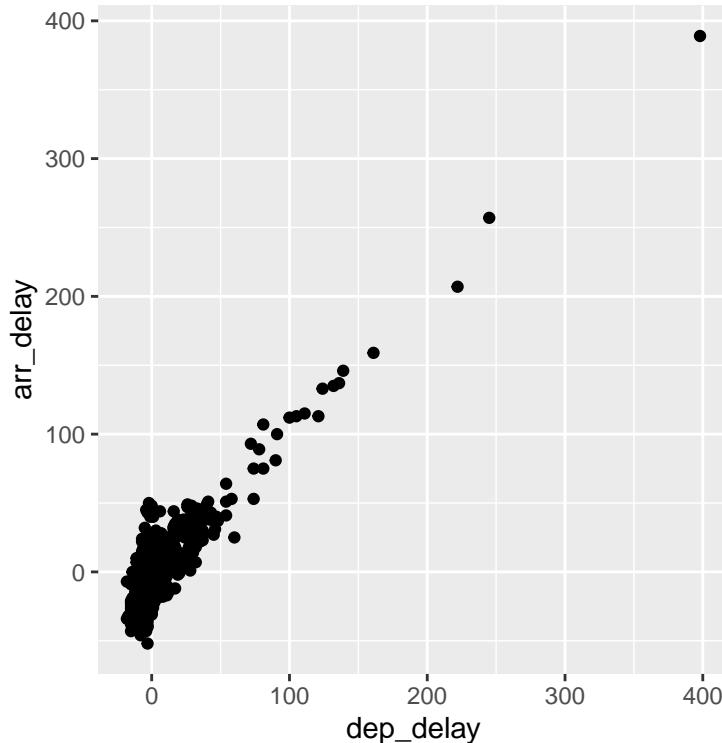

Correlation is a standardised measure of covariance

20.3 Libraries and data

```
library(tidyverse)
library(magrittr)
library(nycflights13)

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

20.4 Example

20.5 Example

```
flights_nov_20 %>%
  pull(dep_delay) %>% shapiro.test()
```

```
##  
## Shapiro-Wilk normality test  
##  
## data: .  
## W = 0.39881, p-value < 2.2e-16
```

```
flights_nov_20 %>%  
  pull(arr_delay) %>% shapiro.test()
```

```
##  
## Shapiro-Wilk normality test  
##  
## data: .  
## W = 0.67201, p-value < 2.2e-16
```

20.6 Pearson's r

```
# note the use of %%  
# instead of %>%  
flights_nov_20 %$%  
  cor.test(dep_delay, arr_delay)
```

If two variables are **normally distributed**
use **Pearson's r**

The square of the correlation value indicates

```
##  
the percentage of shared variance ## Pearson's product-moment correlation  
If they were normally distributed, but they are##  
not  
• 0.882 ^ 2 = 0.778 ## data: dep_delay and arr_delay  
• departure and arrival delay would share## t = 58.282, df = 972, p-value < 2.2e-16  
77.8% of variance ## alternative hypothesis: true correlation is not equal to 0  
## 95 percent confidence interval:  
## 0.8669702 0.8950078  
## sample estimates:  
## cor  
## 0.8817655
```

20.7 Spearman's rho

```

flights_nov_20 %$%
cor.test(
  dep_delay, arr_delay,
  method = "spearman")

```

If two variables are **not normally distributed**, use **Spearman's rho**

- non-parametric
- based on rank difference

The square of the correlation value indicates the percentage of shared variance
If few ties, but there are

- $0.536^2 = 0.287$
- departure and arrival delay *would share* 28.7% of variance

```

## Warning in cor.test.default(dep_delay, arr_delay, method = "spe
## compute exact p-value with ties

## Spearman's rank correlation rho
##
## data: dep_delay and arr_delay
## S = 71437522, p-value < 2.2e-16
## alternative hypothesis: true rho is not equal to 0
## sample estimates:
##      rho
## 0.5361247

```

20.8 Kendall's tau

```

flights_nov_20 %$%
cor.test(
  dep_delay, arr_delay,
  method = "kendall")

```

If **not normally distributed** and there is a **large number of ties**, use **Kendall's tau**

- non-parametric
- based on rank difference

The square of the correlation value indicates the percentage of shared variance
Departure and arrival delay seem actually to share

- $0.396^2 = 0.157$
- **15.7% of variance**

```

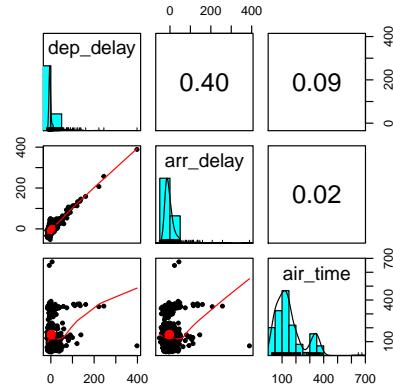

## Kendall's rank correlation tau
##
## data: dep_delay and arr_delay
## z = 17.859, p-value < 2.2e-16
## alternative hypothesis: true tau is not equal to 0
## sample estimates:
##      tau
## 0.3956265

```

20.9 Pairs plot

Combines in one visualisation: histograms, scatter plots, and correlation values for a set of variables

```
library(psych)
flights_nov_20 %>%
  select(
    dep_delay,
    arr_delay,
    air_time
  ) %>%
  pairs.panels(
    method = "kendall"
  )
```

20.10 Summary

Correlation

- Pearson's r
- Spearman's rho
- Kendall's tau
- Pairs plot

Next: Data transformations

- Z-scores
- Logarithmic transformations

Chapter 21

Data transformations

21.1 Recap

Prev: Correlation

- Pearson's r
- Spearman's rho
- Kendall's tau
- Pairs plot

Now: Data transformations

- Z-scores
- Logarithmic transformations

21.2 Libraries and data

```
library(tidyverse)
library(magrittr)
library(nycflights13)

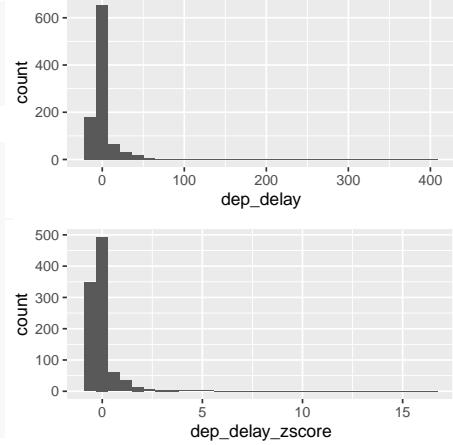

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

21.3 Z-scores

Z-scores transform the values as relative to the distribution mean and standard deviation

```
flights_nov_20 %>%
  ggplot(aes(x = dep_delay)) +
  geom_histogram()

flights_nov_20 %>%
  mutate(
    dep_delay_zscore =
      scale(dep_delay)
  ) %>%
  ggplot(
    aes(x = dep_delay_zscore)
  ) +
  geom_histogram()
```

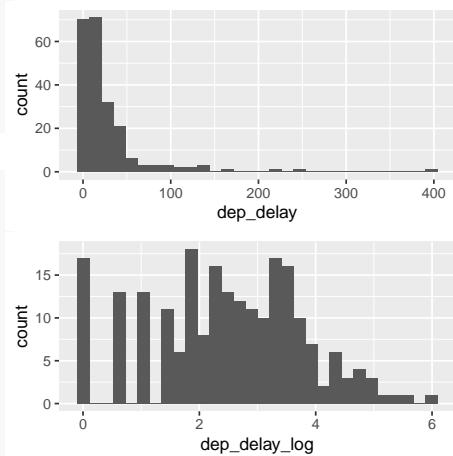

21.4 Log transformation

Logarithmic transformations (e.g., `log` and `log10`) are useful to “*un-skew*” variables, but only possible on values > 0

```
flights_nov_20 %>%
  filter(dep_delay > 0) %>%
  ggplot(aes(x = dep_delay)) +
  geom_histogram()

flights_nov_20 %>%
  filter(dep_delay > 0) %>%
  mutate(
    dep_delay_log =
      log(dep_delay)
  ) %>%
  ggplot(
    aes(x = dep_delay_log)
  ) +
  geom_histogram()
```

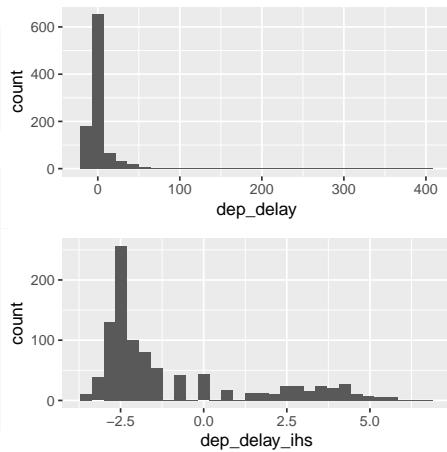

21.5 Inverse hyperbolic sine

Inverse hyperbolic sine (`asinh`) transformations are useful to “*un-skew*” variables, similar to logarithmic transformations, work on all values

```
flights_nov_20 %>%
  ggplot(aes(x = dep_delay)) +
  geom_histogram()

flights_nov_20 %>%
  mutate(
    dep_delay_ihs =
      asinh(dep_delay)
  ) %>%
  ggplot(
    aes(x = dep_delay_ihs)) +
  geom_histogram()
```

21.6 Summary

Data transformations

Chapter 22

Simple Regression

22.1 Recap

Prev: Comparing data

- 311 Lecture Comparing groups
- 312 Lecture Correlation
- 313 Lecture Data transformations
- 314 Practical session

Now: Simple Regression

- Regression
- Ordinary Least Squares
- Fit

22.2 Regression analysis

Regression analysis is a supervised machine learning approach

Predict the value of one outcome variable as

$$\text{outcome}_i = (\text{model}) + \text{error}_i$$

- one predictor variable (**simple / univariate** regression)

$$Y_i = (b_0 + b_1 * X_{i1}) + \epsilon_i$$

- more predictor variables (**multiple / multivariate** regression)

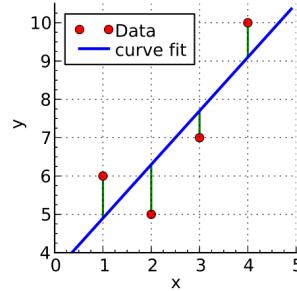

$$Y_i = (b_0 + b_1 * X_{i1} + b_2 * X_{i2} + \dots + b_M * X_{iM}) + \epsilon_i$$

22.3 Least squares

Least squares is the most commonly used approach to generate a regression model

The model fits a line

- to minimise the squared values of the **residuals** (errors)
- that is squared difference between
 - observed values
 - model

by Krishnavedala via Wikimedia Commons, CC-BY-SA-3.0

$$\text{deviation} = \sum (\text{observed} - \text{model})^2$$

22.4 Libraries and data

```
library(tidyverse)
library(magrittr)
library(nycflights13)

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

22.5 Example

$$\text{arr_delay}_i = (b_0 + b_1 * \text{dep_delay}_{i1}) + \epsilon_i$$

```
delay_model <- flights_nov_20 %>% # Note %%
  lm(arr_delay ~ dep_delay)

delay_model %>%  summary()
```

```

## 
## Call:
## lm(formula = arr_delay ~ dep_delay)
## 
## Residuals:
##   Min     1Q Median     3Q    Max 
## -43.906 -9.022 -1.758  8.678 57.052 
## 
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)    
## (Intercept) -4.96717  0.43748 -11.35 <2e-16 ***
## dep_delay    1.04229  0.01788  58.28 <2e-16 ***  
## --- 
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1 
## 
## Residual standard error: 13.62 on 972 degrees of freedom
## Multiple R-squared:  0.7775, Adjusted R-squared:  0.7773 
## F-statistic: 3397 on 1 and 972 DF,  p-value: < 2.2e-16

```

22.6 Overall fit

The output indicates

- **p-value:** $< 2.2\text{e-}16$: $p < .001$ the model is significant
 - derived by comparing the calculated **F-statistic** value to F distribution 3396.74 having specified degrees of freedom (1, 972)
 - Report as: $F(1, 972) = 3396.74$
- **Adjusted R-squared:** **0.7773**: the departure delay can account for 77.73% of the arrival delay
- **Coefficients**
 - Intercept estimate -4.9672 is significant
 - `dep_delay` (slope) estimate 1.0423 is significant

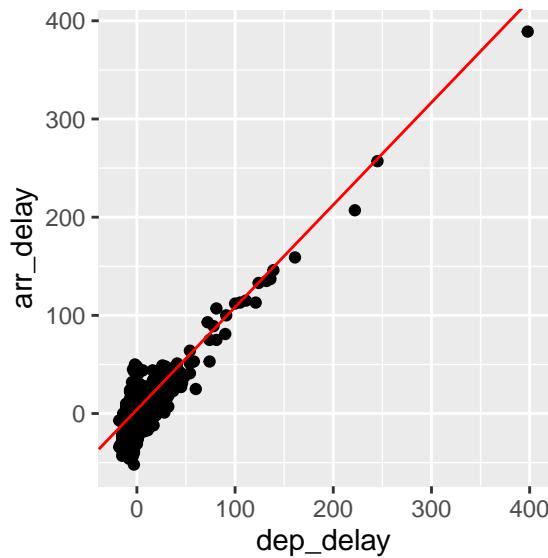

22.7 Parameters

$$arr_delay_i = (Intercept + Coefficient_{dep_delay} * dep_delay_{i1}) + \epsilon_i$$

```

flights_nov_20 %>%
  ggplot(aes(x = dep_delay, y = arr_delay)) +
  geom_point() + coord_fixed(ratio = 1) +
  geom_abline(intercept = 4.0943, slope = 1.04229, color="red")

```

22.8 Summary

Simple Regression

- Regression
- Ordinary Least Squares
- Fit

Next: Assessing regression assumptions

- Normality
- Homoscedasticity
- Independence

Chapter 23

Assessing regression assumptions

23.1 Recap

Prev: Simple Regression

- Regression
- Ordinary Least Squares
- Fit

Now: Assessing regression assumptions

- Normality
- Homoscedasticity
- Independence

23.2 Checking assumptions

- **Linearity**
 - the relationship is actually linear
- **Normality** of residuals
 - standard residuals are normally distributed with mean 0
- **Homoscedasticity** of residuals

- at each level of the predictor variable(s) the variance of the standard residuals should be the same (*homo-scedasticity*) rather than different (*hetero-scedasticity*)

- **Independence** of residuals
 - adjacent standard residuals are not correlated
- When more than one predictor: **no multicollinearity**
 - if two or more predictor variables are used in the model, each pair of variables not correlated

23.3 Libraries and data

```
library(tidyverse)
library(magrittr)
library(nycflights13)

flights_nov_20 <- nycflights13::flights %>%
  filter(!is.na(dep_delay), !is.na(arr_delay), month == 11, day == 20)
```

23.4 Example

$$arr_delay_i = (b_0 + b_1 * dep_delay_{i1}) + \epsilon_i$$

```
delay_model <- flights_nov_20 %$% # Note %$%
  lm(arr_delay ~ dep_delay)

delay_model %>% summary()

## 
## Call:
## lm(formula = arr_delay ~ dep_delay)
## 
## Residuals:
##     Min      1Q  Median      3Q     Max 
## -43.906   -9.022  -1.758   8.678   57.052 
## 
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)    
## (Intercept) -4.96717   0.43748 -11.35   <2e-16 ***
## dep_delay    1.04229   0.01788  58.28   <2e-16 ***

## 
## Residual standard error: 13.62 on 972 degrees of freedom
## Multiple R-squared:  0.7775, Adjusted R-squared:  0.7773 
## F-statistic: 3397 on 1 and 972 DF,  p-value: < 2.2e-16
```

23.5 Normality

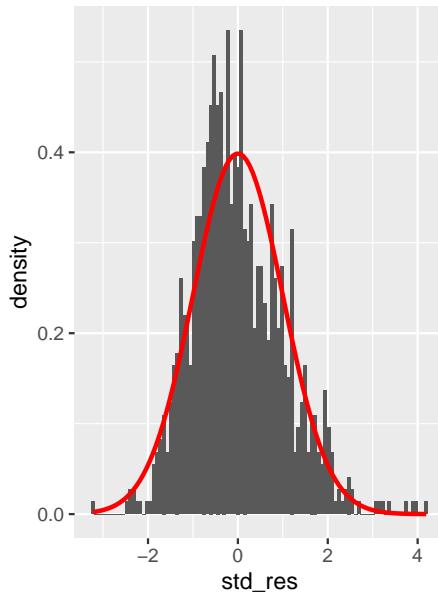

Shapiro-Wilk test for normality of standard residuals,

- robust models: should be not significant

```
delay_model %>%
  rstandard() %>%
  shapiro.test()

## 
## Shapiro-Wilk normality test
## 
## data: .
## W = 0.98231, p-value = 1.73e-0
```

Standard residuals are NOT normally distributed

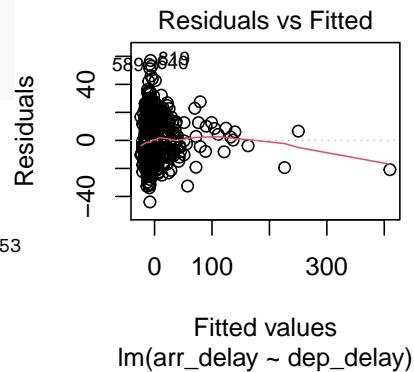

23.6 Homoscedasticity

Breusch-Pagan test for homoscedasticity of standard residuals

- robust models: should be not significant

```
library(lmtest)
delay_model %>%
  bptest()

##
## studentized Breusch-Pagan test
##
## data: .
## BP = 0.017316, df = 1, p-value = 0.8953
Standard residuals are homoscedastic
```

23.7 Independence

Durbin-Watson test for the independence of residuals

- robust models: statistic should be close to 2 (between 1 and 3) and not significant

```
# Also part of the library lmtest
delay_model %>%
  dwtest()

##
## Durbin-Watson test
##
## data: .
## DW = 1.8731, p-value = 0.02358
## alternative hypothesis: true autocorrelation is greater than 0
```

Standard residuals might not be completely independent

Note: the result depends on the order of the data.

- What's Machine Learning?
- Types
- Limitations

25.2 Definition

“The field of machine learning is concerned with the question of how to construct computer programs that automatically improve with experience.”

Mitchell, T. (1997). Machine Learning. McGraw Hill.

25.3 Origines

- Computer Science:

- how to manually program computers to solve tasks

- **Statistics:**

- what conclusions can be inferred from data

- **Machine Learning:**

- intersection of **computer science** and **statistics**
 - how to get computers to **program themselves** from experience plus some initial structure
 - effective data capture, store, index, retrieve and merge
 - computational tractability

Mitchell, T.M., 2006. The discipline of machine learning (Vol. 9). Pittsburgh, PA: Carnegie Mellon University, School of Computer Science, Machine Learning Department.

25.4 Types of machine learning

Machine learning approaches are divided into two main types

- **Supervised**

- training of a “*predictive*” model from data
 - one attribute of the dataset is used to “predict” another attribute
 - e.g., classification

- **Unsupervised**

- discovery of *descriptive* patterns in data
 - commonly used in data mining
 - e.g., clustering

25.5 Supervised

- Training dataset
 - input attribute(s)
 - attribute to predict
- Testing dataset
 - input attribute(s)
 - attribute to predict
- Type of learning model
- Evaluation function
 - evaluates difference between prediction and output in testing data

```

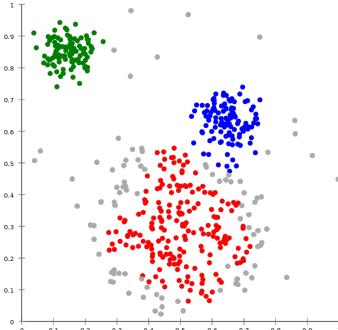

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2
3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3
4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4 4
5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5
6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6 6
7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7
8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8 8
9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9

```

by Josef Steppan via Wikimedia Commons, CC-BY-SA-4.0

25.6 Unsupervised

- Dataset
 - input attribute(s) to explore
- Type of model for the learning process
 - most approaches are iterative
 - e.g., hierarchical clustering
- Evaluation function
 - evaluates the quality of the pattern under consideration during one iteration

by Chire via Wikimedia Commons, CC-BY-SA-3.0

25.7 ... more

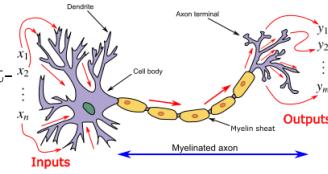

- **Semi-supervised learning**
 - between unsupervised and supervised learning
 - combines a small amount of labelled data with a larger un-labelled dataset
 - continuity, cluster, and manifold (lower dimensionality) assumption

- Reinforcement learning

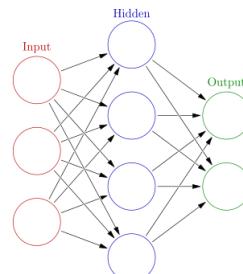

- training agents take actions to maximize reward
- balancing
 - * exploration (new paths/options)
 - * exploitation (of current knowledge)

25.8 Neural networks

Supervised learning approach simulating simplistic neurons

- Classic model with 3 sets
 - input neurons
 - output neurons
 - hidden layer
 - * combines input values using **weights**
 - * **activation function**
- The **training algorithm** is used to define the best weights

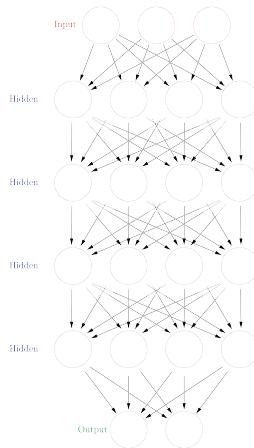

by Egm4313.s12 and Glosser.ca via
Wikimedia Commons, CC-BY-SA-3.0

25.9 Deep neural networks

Neural networks with **multiple hidden layers**

The fundamental idea is that “*deeper*” neurons allow for the encoding of more complex characteristics

Example: De Sabbata, S. and Liu, P. (2019). Deep learning geodemographics with autoencoders and geographic convolution. In proceedings of the 22nd AGILE Conference on Geographic Information Science, Limassol, Cyprus.

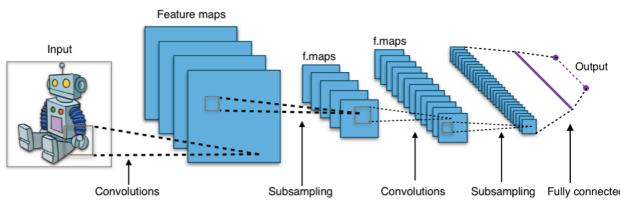

derived from work by Glosser.ca via Wikimedia Commons, CC-BY-SA-3.0

25.10 Convolutional neural networks

Deep neural networks with **convolutional hidden layers**

- used very successfully on image object recognition
- convolutional hidden layers “*convolve*” the images
 - a process similar to applying smoothing filters

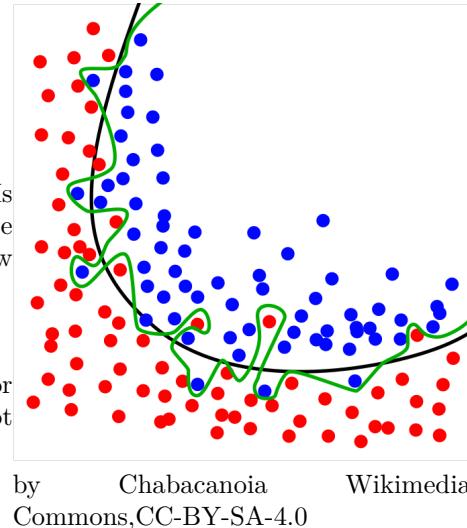

Example: Liu, P. and De Sabbata, S. (2019). Learning Digital Geographies through a Graph-Based Semi-supervised Approach. In proceedings of the 15th International Conference on GeoComputation, Queenstown, New Zealand.

by Aphex34 via Wikimedia Commons, CC-BY-SA-4.0

25.11 Limits

- Complexity
- Training dataset quality
 - garbage in, garbage out
 - e.g., Facial Recognition Is Accurate, if You're a White Guy by Steve Lohr (New York Times, Feb. 9, 2018)
- Overfitting
 - creating a model perfect for the training data, but not generic enough to be useful

25.12 Summary

Machine Learning

- What's Machine Learning?
- Types
- Limitations

Next: Centroid-based clustering

- K-means
- Fuzzy c-means
- Geodemographic classification

Chapter 26

Centroid-based clustering

26.1 Recap

Prev: Machine Learning

- What's Machine Learning?
- Types
- Limitations

Now: Centroid-based clustering

- K-means
- Fuzzy c-means
- Geodemographic classification
- Hierarchical
- Mixed
- Density-based

26.2 Clustering task

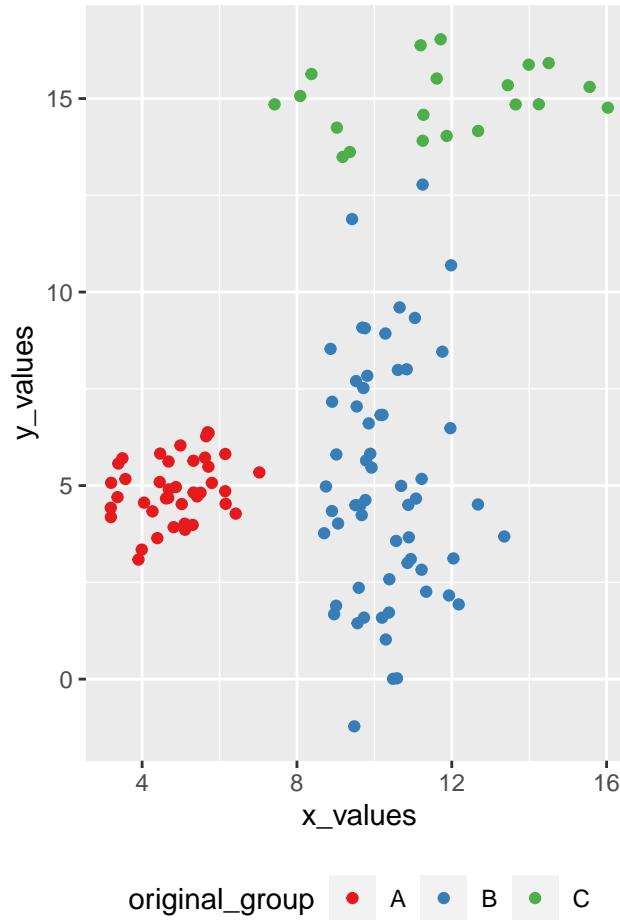

*"Clustering is an unsupervised machine learning task that automatically divides the data into **clusters**, or groups of similar items".* (Lantz, 2019)

Methods:

- Centroid-based
 - k-means
 - fuzzy c-means
- Hierarchical
- Mixed
 - bootstrap aggregating
- Density-based
 - DBSCAN

26.3 Example

```
data_to_cluster <- data.frame(  
  x_values = c(rnorm(40, 5, 1), rnorm(60, 10, 1), rnorm(20, 12, 3)),  
  y_values = c(rnorm(40, 5, 1), rnorm(60, 5, 3), rnorm(20, 15, 1)),  
  original_group = c(rep("A", 40), rep("B", 60), rep("C", 20)) )
```

26.4 k-means

k-mean clusters n observations in k clusters, minimising the within-cluster sum of squares (WCSS)

Algorithm: k observations randomly selected as initial centroids, then repeat

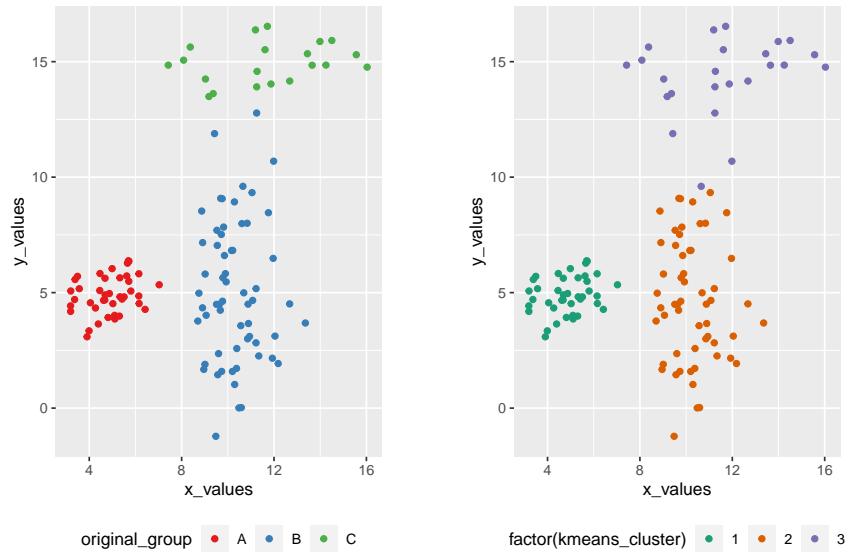

- **assignment step:** observations are assigned to the closest centroids
- **update step:** calculate means for each cluster to use as new the centroid

until centroids don't change anymore, the algorithm has **converged**

```
kmeans_found_clusters <- data_to_cluster %>%
  select(x_values, y_values) %>%
  kmeans(centers=3, iter.max=50)

data_to_cluster <- data_to_cluster %>%
  add_column(kmeans_cluster = kmeans_found_clusters$cluster)
```

26.5 K-means result

26.6 Fuzzy c-means

Fuzzy c-means is similar to k-means but allows for "fuzzy" membership to clusters

Each observation is assigned with a value per each cluster

- usually from 0 to 1
- indicates how well the observation fits within the cluster
- i.e., based on the distance from the centroid

```
library(e1071)

cmeans_result <- data_to_cluster %>%
```

```
select(x_values, y_values) %>%
  cmeans(centers=3, iter.max=50)

data_to_cluster <- data_to_cluster %>%
  add_column(c_means_assigned_cluster = cmeans_result$cluster)
```

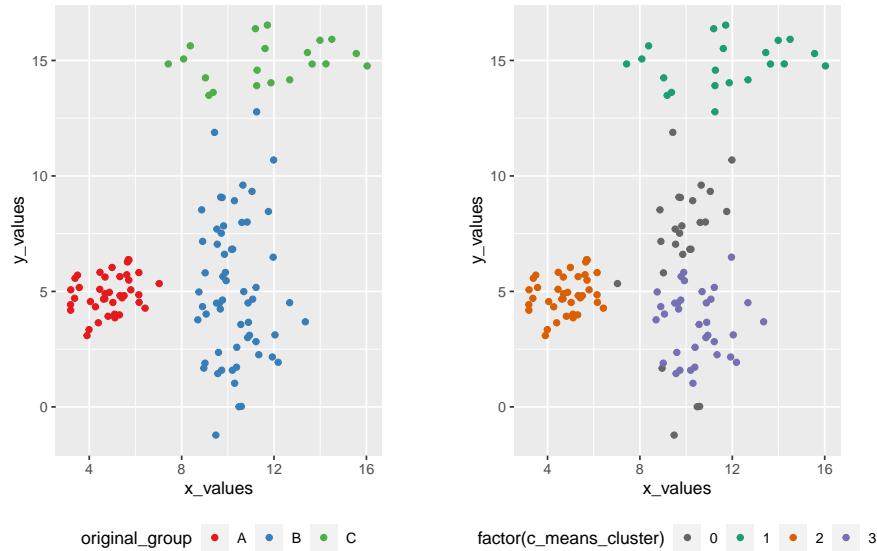

26.7 Fuzzy c-means

A “*crisp*” classification can be created by picking the highest membership value.

- that also allows to set a membership threshold (e.g., 0.75)
- leaving some observations without a cluster

```
data_to_cluster <- data_to_cluster %>%
  add_column(
    c_means_membership = apply(cmeans_result$membership, 1, max)
  ) %>%
  mutate(
    c_means_cluster = ifelse(
      c_means_membership > 0.75,
      c_means_assigned_cluster,
      0
    )
  )
```

26.8 Fuzzy c-means result

26.9 Geodemographic classifications

In GIScience, the clustering is commonly used to create *geodemographic classifications* such as the 2011 Output Area Classification (Gale *et al.*, 2016)

- initial set of 167 prospective variables from the United Kingdom Census 2011
 - 86 were removed,
 - 41 were retained as they are
 - 40 were combined
 - final set of 60 variables.
- k-means clustering approach to create
 - 8 supergroups
 - 26 groups
 - 76 subgroups.

26.10 Summary

Centroid-based clustering

- K-means
- Fuzzy c-means
- Geodemographic classification

Next: Hierarchical and density-based clustering

- Hierarchical
- Mixed
- Density-based

Chapter 27

Hierarchical and density-based clustering

27.1 Recap

Prev: Centroid-based clustering

- K-means
- Fuzzy c-means
- Geodemographic classification

Now: Hierarchical and density-based clustering

- Hierarchical
- Mixed
- Density-based

27.2 Libraries

```
library(tidyverse)

## -- Attaching packages ----

## v ggplot2 3.3.2      v purrr   0.3.4
## v tibble   3.0.3      v dplyr    1.0.0
## v tidyverse 1.1.0      v stringr  1.4.0
## v readr    1.3.1      vforcats  0.5.0
```

```
## -- Conflicts -----
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()

library(e1071)
library(dbSCAN)

## Warning: package 'dbSCAN' was built under R version 4.0.2
```

27.3 Example

```
data_to_cluster <- data.frame(
  x_values = c(rnorm(40, 5, 1), rnorm(60, 10, 1), rnorm(20, 12, 3)),
  y_values = c(rnorm(40, 5, 1), rnorm(60, 5, 3), rnorm(20, 15, 1)),
  original_group = c(rep("A", 40), rep("B", 60), rep("C", 20)) )
```

27.4 Hierarchical clustering

Algorithm: each object is initialised as, then repeat

- join the two most similar clusters based on a distance-based metric
- e.g., Ward's (1963) approach is based on variance

until only one single cluster is achieved

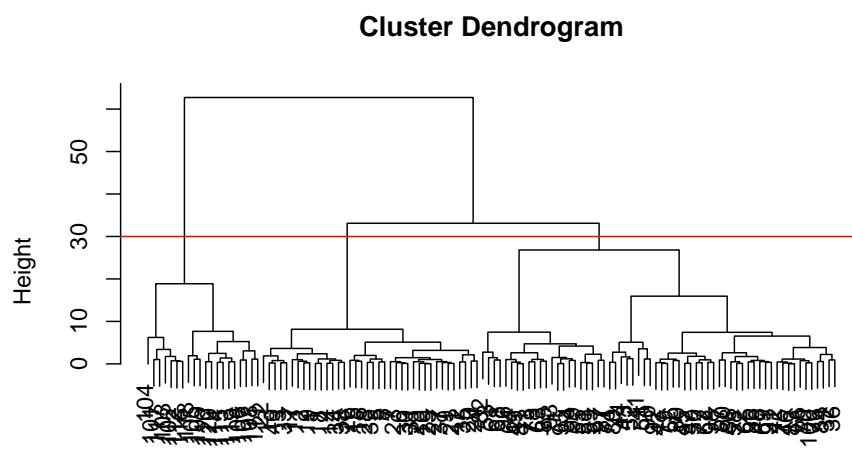

```
hclust_result <- data_to_cluster %>%
  select(x_values, y_values) %>%
  dist(method="euclidean") %>%
  hclust(method="ward.D2")

data_to_cluster <- data_to_cluster %>%
  add_column(hclust_cluster = cutree(hclust_result, k=3))
```

27.5 Clustering tree

This approach generates a clustering tree (dendrogram), which can then be “*cut*” at the desired height

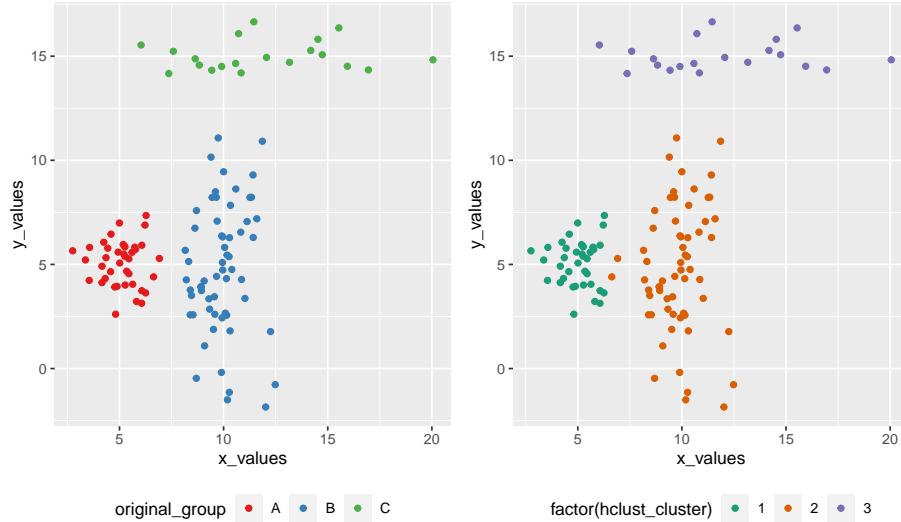

```
plot(hclust_result) + abline(h = 30, col = "red")
```

hclust (*, "ward.D2")

```
## integer(0)
```

27.6 Hierarchical clustering result

27.7 Bagged clustering

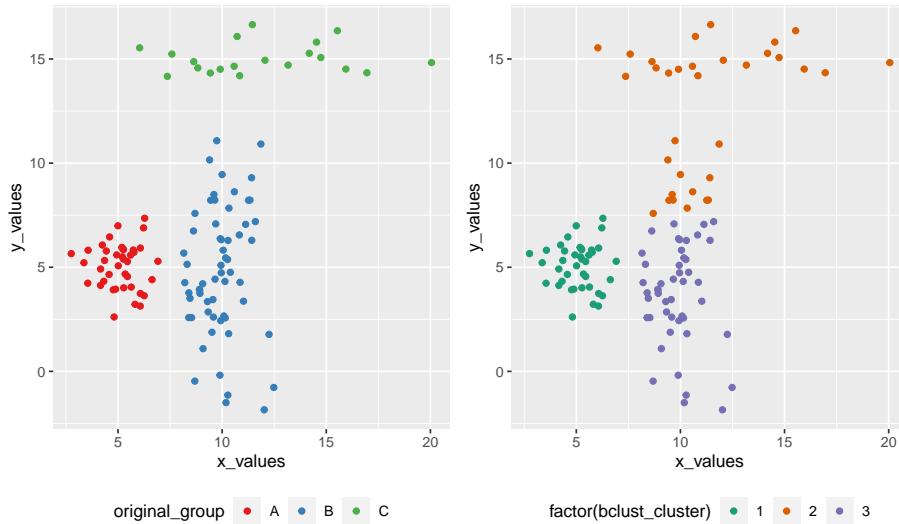

Bootstrap aggregating (*b-agg-ed*) clustering approach (Leisch, 1999)

- first k-means on samples
- then a hierarchical clustering of the centroids generated through the samples

```
bclust_result <- data_to_cluster %>%
  select(x_values, y_values) %>%
  bclust(hclust.method="ward.D2", resample = TRUE)

data_to_cluster <- data_to_cluster %>%
  add_column(bclust_cluster = clusters.bclust(bclust_result, 3))
```

27.8 Bagged clustering result

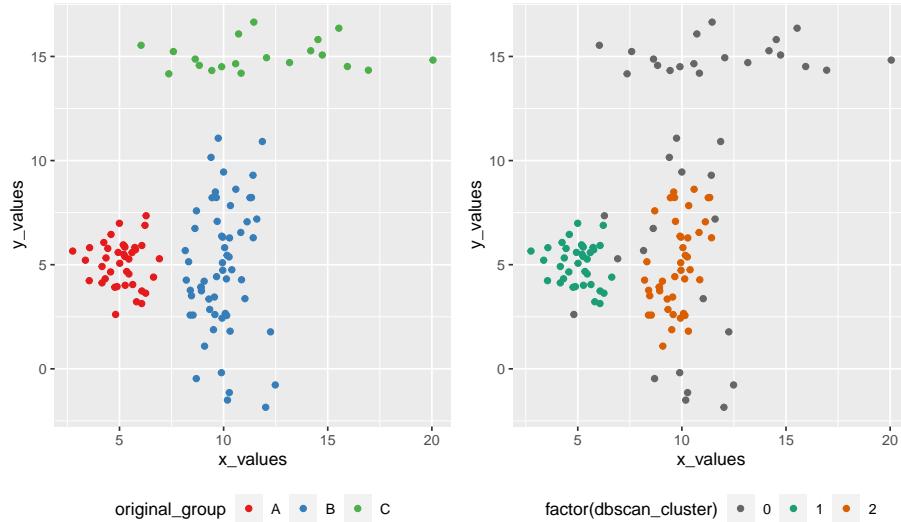

27.9 Density based clustering

DBSCAN (“density-based spatial clustering of applications with noise”) starts from an unclustered point and proceeds by aggregating its neighbours to the same cluster, as long as they are within a certain distance. (Ester *et al*, 1996)

```
dbSCAN_result <- data_to_cluster %>%
  select(x_values, y_values) %>%
  dbSCAN(eps = 1, minPts = 5)

data_to_cluster <- data_to_cluster %>%
  add_column(dbSCAN_cluster = dbSCAN_result$cluster)
```

27.10 DBSCAN result
